hello everybody ,i wish to gather a tiny tidbit of personal info..

how many of us in the atari field use midi on the machines?

i am writing midi program and want suggestions and beta -testers.

charles

Not sure if this has been discussed here-tryin to figure out the fastest way to get a midi file from my Mega STe to a PC w/o using a floppy. Sequencing on the Atari, recording audio on the PC. Any ideas on this config. appreciated.
tnx,
fcr

No no no. Use a sequencer on the PC too. Slave the PC's midi clock to
the Atari. Press record on the PC, then play on the Atari's sequencer.
Save the file on the PC as a .mid (or whatever you use now).

You've got a couple of options. If you've got a LAN, get an EtherNEC for the Mega STe. Plugs into its cartridge port and is quite fast.

That would be my first/best option.

After that, you could go with things like a null-modem cable and Ghostlink.

HTHs.

yes this is to responce the request for a "s.a.m.s." for atari ,i found
this.

http://retrobits.net/atari/sam.shtml

i'm sure you wanted this instead of a system audio manager.

charles

Hi All,
I am looking for games for this comp. but I am not looking for roms or anything like this.
I am interested only in games which I wll be able to play on Atari. (copy from PC to flopy disk -> atari)
Could You please give me website address?
Thank You in advance!

For sale:

Pocket S/PDIF interface (PSI BlowUp) for the Atari (or compatible) Falcon.
Optical S/PDIF in and out.
Coax S/PDIF in and out.

An infra-red device is included for infra-red communication using the Falcon.

I've used it with a C-lab Falcon mkII and it works fine.

Data-DAT software is included, to take backup copies on DAT.

Price: $50 plus freight from Sweden.

Here's an image of the package:
http://web.comhem.se/~u11149557/BlowUpSPDIF-interface.jpg

Pay with PayPal. I send the hardware when you have paid.

Email: mikael@mhc.se and please write "S/PDIF interface for the Atari" in the subject line to avoid accidental delete of the email.

Regards
Mike

What are the characteristics of the Falcon video port? My problem is
that my new LCD monitor doesn't recognize that my Falcon is connected
to it. If the LCD doesn't recognize that something is connected to its
port then that port is not selectable (it has VGA, SCART, COMPOSITE,
COMPONENT inputs).
First I must connect the LCD to my PC. By turning the PC on the monitor
recognizes that its there is something on its VGA input, so I can

select (in the LCD) the VGA port as an input source. I can now connect my Falcon to it and everything is ok. I can use my Falcon with my CRT display with no problem.

Help me please...

This article is dedicated to:

A man I met, with most of his body heavily burned, simply because he was a Chinese during the 1998 May Riot in Indonesia.
Lots of capitalists that are slaughtered during the cultural evolution.
Ten thousands of peaceful smugglers that are massacred in Banda island by the Dutch for conducting peaceful spice trade and all that are similar to them.
All minority groups and individuals that face discrimination, even genocide, for economically contributing too much for their society.

All customers that have to pay higher products due to protection of tariff and trades.
Productive people that are fined with income tax for the victimless crime of making honest money.
Smart students that are slowed down so not to move too fast.
Industries that do not get subsidy, or even banned to protect unproductive industry and laborers that earn much less due to such restrictions.
Poor starving people that could have been rich had their countries choose to embrace free market.
Women and males that are trapped in unhappy marriage which they have a hard time getting out.
Women and children that have lots of their best choices taken under the pretext of protection.
Immigrants and refuges.
Is welfare part of capitalism?

In short, no. In consensually, punishing the productive through income tax to reward parasitic behavior is the biggest affront against the principle of free market. In fact, from many governments intervention in economy, the one that proponents of free market often oppose the most is welfare.

However, when we look further, capitalism and welfare is not really total opposites. Most importantly, properly done, a straight forward welfare program can cause less market distortion, and hence an efficient replacement to buy votes from losers, than farm subsidies, public schools, minimum wage, trades restrictions, tariffs, and sex laws. If it's done by taxing wealth, rather than income, the amount of market distortion can be minimized further.

Welfare is also cheap. It'll cost $5000/year to a welfare recipient in USA, for example. However, we need to remember that the recipients' lifestyle worth only $500. The other $4500 goes to implicit welfare due to higher living costs. That implicit welfare includes minimum wage, immigrations laws, and food subsidy, or protections.

If somehow a straight forward explicit welfare program can replace all relatively more evil governments' interventions, then capitalists are probably better of not opposing welfare so much. Even Milton Friedman supports schemes called guaranteed minimum income, which is like welfare but with much less market distortion.

That's not where the similarity ends. One of the main creeds of capitalism is that consent and competition should be preferred over force. Without that consent, anyone can simply make us choose to make our self worst of under the pretext that it is for our own good. In fact, most laws against consensual acts can be traced down to protection of some disgruntled competitors often done under the pretext of the consenting parties' own good.

Anti prostitution and anti polygamy laws, for example, is there to ration females to poor dumb males under the pretext of protecting the consenting women. Of course, all natural resources tend to be rationed somewhat proportional to ones' voting power. And that does explain why democracy and anti polygamy laws go hand in hand too. One man one vote soon leads to one man one wife.

Well, at least Matt Ridley agrees with me and he's a well known mainstream scientific researchers. I guess that's also why so many uncompetitive people want to ensure that evolution theory is not taught in school. You can also read a famous psikiatrist book, "The road less traveled," you'll see that life long monogamous marriage is just a trap to prevent highly desirable people from being available to those who they want more, and romance is just the lure to that trap.

On the women side, anti pornography laws is really meant to prevent highly desirable women from advertising her assets and hence protecting less pretty women from the higher industry standard a public display of superior desirability might cause. Countries that embrace porn tend to have prettier women. Where did all the unsexy ones go? They're all shifting out of the gene pool, and hence are doing their best to oppose porn preaching religious doctrines that men should judge women based on any features but beauty, which they can't offer.

Another issue is consent. Welfare program is not consensual; however, it's relatively more consensual then civil war. In ancient time, when we have different ideological opinions, we end up killing each other to proof who are "right." The Catholic would kill the Gnostic, the Sunni would kill the Shiah. One King would kill the other. A younger prince will argue that the older prince is demon. Might makes right.

Such differences of opinions are of course solved with war, which is a very cost inefficient way to know who're "right." However it does work in some subjective practical sense. If we look in the past and try to figure out whether the Gnostic or the Catholic is the one that's heretical or "right" respectively, we need only to see who won. The Gnostics are slaughtered, so they must be the heretic, or do they? At least I bet there are way more people in the world that think that way than the other way around, excluding me actually.

It doesn't matter how many books many institutionalized religions burned, how much restrictions of freedom of speech and irrationality they embraced, how many witnesses they snuffed outs and all other techniques that would not have stand the scrutiny of a peer reviewed scientific journal, or even a reasonable jury in the court of law. Too many people don't believe who are right and reasonable, they believe who are mighty. Right or wrong, the win will always become right anyway.

Now, under democratic context, we don't kill those who oppose us, rather we try to persuade enough people to join our cause. How do we persuade them? By money of course. Welfare program is then a reasonably cost efficient method to buy votes.

When too many people are on a side, we will sort of know that going to war will hurt the other side; hence we comply anyway with the whim of majority avoiding the costly alternatives. While not ideal, this is indeed how right and wrong is really decided, proper assessments of each sides' bargaining position and mutually cherished compromised line of war, plus a bunch of lies covering what's going on to safe each sides' face.

No matter how noble the purpose, lies and prejudices lead to misunderstanding, that leads to more war. Hence, the best contribution is simply to unmask all lies.

All in all, peaceful democracy is indeed a more cost efficient ways to measure ones' bargaining position. While democracy often lead to decisions opposites of freedom, like popularly supported victimless crime, income tax, and welfare, it's indeed relatively more cost efficient than civil war.

That's not when the coherency end. Various natural laws restrict various possible political outcomes. We can't expect a stone will fly to the sky when we drop it as much as we cannot expect a human to be generally unselfish. If we want to kill our enemies, we'll do well dropping a big stone on top of our enemies head rather than dropping the stone on top of our own head expecting the stone to somewhat magically fly to the enemies head.

The same way, we can't demand market distortion and expect that the best and brightest among us to still magically be a nice tax payer rather than dictators and corruptors. In a country where selling porn or building a good franchise chain is more difficult and less lucrative than becoming a dictator, guess what the smart would end up doing? Ask Saddam.

If we want rich and prosperous countries, we must know that it will and only will happen when we properly align individuals' interests with productivity.

Such coherency tends to make certain things come in package with another. We can expect that moving electric field will induce magnetic field. The same way, in life, we observe similar things. Communism and socialism, for example, always come in package with dictatorship and corruptions when smart people realize that being dictators pay more than building a business empire.

To the opposite capitalistic countries comes in package with softer deals for losers, such as, guess what, welfare.

We know from our economic classes that free market capitalism brings prosperity within market mechanism. However, it turns out that the prosperity that free market brings also profit the less successful beyond market mechanism. Capitalism and the prosperity that come with it tend to facilitate ideological changes in ways that benefit the less successful. One such ideological change is the popular support for losers' benefits. One such benefit is, guess what, welfare.

The most obvious samples of such ideological shifts the free market bring are the elimination of slavery in US. What happened? As usual, the northern part of America is an industrial country. At that time, steel industries are relatively more modern than the farming industry. Higher tech industry increase labors' productivity. When labor's productivity goes up, entrepreneurs will want to hire as many workers as possible. Hence, labors' salary will go up. This will kill of industries with less labor's productivity. At the end, the marginal productivity of labors in the least productive industry will go up. That value is labors' salary.

Under competitive equilibrium, the more productive and efficient a person is, the more he benefits everyone in the chain of productivity except those similar to him. Hence, an entrepreneurs coming up with ways to improve labors' productivity would benefit everyone, including workers and consumers, at the expense of other entrepreneurs and capitalists. Read that Karl Marx!

Then what? When labors' salary goes up, obviously labors will move to the employers that pay them higher. Hence, farm labors in the south want to move to the north. They can't do so legally though because they were slaves. Hence, the northern capitalists in US want to free slaves so they can hire more workers. And then the southern capitalists in US want to keep slavery. This then results in war. The bigger the labors' productivity, the more intensive capitalists have to free slaves. The more supporters there will be on a cause the more likely the cause won. Hence, slaves were freed.

Unfortunately, people still want to help losers and buy votes from those who are too expensive and too stubborn to switch. That explains why the farms in US gets subsidy.

If losing means not as successful as the other, then there will always be losers. However, we see how free market shifts the worlds' system in ways that benefits the losers too. Unlike the commies' propaganda, capitalism does not cause or even enlarge disparity of wealth. Capitalism only changes the way such disparity are earned to the benefits of all.

At the end of the warring states period in China, the king of Chin, Shih Huang Ti, and his prime minister, Li Si were the winner. Within one generation they have all their family slaughtered. If that's what winning means, what did losing means in pre-capitalistic countries? In ancient time, losing meant having all the males slaughtered, enslaved, or castrated and all the females raped and winning means risking your whole family slaughtered by rebels. In socialists countries the rich are corruptors and dictators that slice each other throats while the poor are starving.

Now, thanks to the prosperity only free market can bring, losing means they can leave on welfare, with plenty of chance to climb back and proof their worth, like J. K. Rowling. Now, slaves are so free and highly paid thanks to increase in labors' productivity. In fact, when slave jobs are moving to China under globalization, slaves in US refused to be emancipated and want to keep their slave jobs in US rather than evolving into entrepreneurs. So, much for the land of the free and the place of the brave. Some people don't mind dying for what they believe in but are too scared to start a business. Evolutions will fix that I guess.

Free market gives abundances to everyone. The benefits the free market brings benefit those less capable from being successful not only within the system but also through non market mechanism, like the ending of slavery and the start of reverse slavery we call welfare. But how do those really work? Is there a general principle?

Each of us is greedy and selfish that we want as many as possible for us. Humans' greed and selfishness is an undisputable scientific facts, as sure as the sun rise in the east, as sure as a stone will fall to the ground pulled by gravity. We're not just greedy and selfish. Greed and selfishness doesn't explain all the war, suffering, and poverty we face.

In fact, greed is good. Properly aligned, under free market, the greatest among us shall be the one productively providing the best service to the most customers. Blessed be the productive because they'll be rich. This will encourage higher and higher standard of living that we are currently enjoying.

Free market allows those who serve more to grow richer. To those who have more profit, to those more capital are given. Even kingdom of heaven don't mind using this nice positive feedback effect. Who needs new deals to break up companies?

Also, women prefer the rich. The next time you watch soap opera, make sure it's made in some country with the highest IQ in the world, like Hong Kong.

Free sex means richer males will consensually attract and mate with more women producing more kids. That's the whole point of getting rich by the way. Duh?

In fact, that's what being a living human male is all about:

1. Gain control ship of as much money or power as possible.

2. Attract or in anyway acquire as many females as possible.

3. Make kids.

4. Use that kids as tools to make grand children.

You bet it's right because it's science. Of course, they don't teach this important fact in biology class because government interfere in education.

Hence, when we're free, without genocide, without war, even with humanitarians aids given to appease enemies, the meek will indeed inherit the earth.

More than greedy and selfish, some humans are simply not humans because they embrace the root of all evil, envy. That explains why we have so many laws against mutually beneficial consensual acts and governments regulations to protect us from our own choices. The truth is, all those laws and restrictions are more often not there to protect stupid people from making mistakes. All such laws are there to prevent the smart from making the right choices.

That's why, for example, every body has to move equally slowly in school, to prevent the smart from moving faster. That's why various reproductive techniques are politically incorrect proportional to the expected quality of genetic material that will be duplicated. In particular, life long monogamous marriage, free sex, prostitution, polygamy, and cloning are sequences that both have increasingly expected value of genetic quality outcome and politically incorrectness.

In Europe and China, the smart monks are encouraged not to get married. When some minority groups don't buy the bullshit and hence greatly improving their productively earned wealth and genetic quality, such minority groups somehow become victims of genocide.

Life is like a real time strategy games. That means when we're not at war, we're in a race. That's simply how we evolve. Morality, religions, and ideologies, are stuffs created by really smart people to persuade us to run backward.

Peace means we're in a race. Freedom means we are in a competition. Some people just don't want to compete. Hence, they craft lies and prejudices against those who are in front preventing progress to prosperity.

I'll tell you the scientific truth. It's from the fruit we knows the tree. Anyone opposing free trades and globalization is more evil than Hitler or Nazi. If only Japan and German could have acquired natural resources through consensual peaceful trade, Nazism wouldn't have been popular there and Hitler wouldn't have risen to power. With his mass hypnotic skills, he may have ended up as seminar speaker I guess.

If only those who had wanted to incite the Second World War see all the miracles and prosperity the free market brings, they would have repented and embrace free market. Yet, after all the prosperity and wealth the free market is bringing to all of us, still many people choose to oppose competition, and hence, miss-properly align our interests from productivity. That is the cause of all evil in the world.

All causes opposing free market can be negotiated and appeased. However, if the very thing that a group of people want to prevent is the success of the others, then the situation is pretty much kill or be killed zero sum game.

How does such situation usually end up? What would be our optimum solutions for such situation?

Under normal circumstances, an optimum solution of any business decisions is a solution where the marginal revenue equals to the marginal costs. Hence, in a zero sum game, each party will try to maximize its benefit to that point. Sometimes, the marginal costs have a spike. There is a certain point where increasing a resources allocation beyond a certain point will create adverse costs. For example, increasing the number of labors will increase revenue.

After a certain point, increasing one additional labor will mean buying a new machine or building a new factory. We may end up choosing to do it, we may not. In either case, discretions are the better part of the valor when it comes to that line.

The same way, in most countries, each of us can increase our profits using property we own or consensually rent. When we maximize our profit that way, the public will, ideally and some times truly, not interfere, and defend us from being prevented to enjoy our "rights" by others. However, when we start using others' property to maximize our gain, say by stealing, public opinions may shift from protecting us to against us.

Hence, the choice whether we should steal or not depends on the extra costs of crossing the politically correctness line of war. If a person sees that the potential gain justifies the increase costs of public support shifts, he'll still steal and make a great career out of it. Otherwise he'll stop stealing while coming up with a pretext to justify his cowardly decisions, such as morality.

But what do the people choose their reaction to a specific act like stealing? They do so based on their sense of fairness, justice, and right-wrong discernment. How do people get that sense? From ideology. The ideology, religions, or whatever, then decides the line of war where the rest of us should consider before crossing. But how does the line gets drawn? By estimates of bargaining position.

Let's examine an example. Is the King (or Queen?) of England the King of France? Don't know. How do we know? In the beginning, a ruling class from France went to England and become king of England. Then they lost control of France. Hence, king of England wanted to take back the controls they have lost. Well, such conflicts are solved by war. In this particular case, the war lasted 100 years.

The British attacked France and successfully route knights with long bows. Then, the Frances stroke back driving the British back to their isolated islands. However, the France cannot move further and go all the way to attack British because of the Strait of Dover separating the two nations. Finally both sides realized that the straits somehow became the sacred line of war. It's not auspicious to cross the line of war for either side. The France, having more army and larger population would beat up the British on land, and the British being stronger at sea can always repulsed France sea invasion. Hence, we got peace.

Such natural separators like straits and mountains explain why Europeans are divided into many different countries. The Chinese, not having that natural line of war, end up getting united all the time.

Now, let's get back to the question whether welfare is part of capitalism. If all of us have just enough food, and some people don't work, what would we end up doing to those who are not productive?

Humans' basic instincts and preferences lead to gene pool survival. When food is scarce, such as when the people demand centralized planning, it would serve ones' gene pool survival to slaughter the parasites rather than sharing food to them. That's because sharing food to those who do not earn it means starving ones own self. In fact, humans will kill each other to literally eat each other when food is scarce. Such is what happened in China and Rusia when centralized planning, governments' intervention in economy, and prejudices against successful capitalists became the norm.

However, when food and money are abundance, such as when the people embrace free market, fighting the parasites might cause more gene pool survival lost than feeding them. On the other hand, simply giving and yielding toward threaten will motivate people to keep pushing us around. Moreover, giving in to those who can use force against us will motivate countries to build arms rather than say, better video games.

Hence, one possible strategy to minimize open war while still properly aligning ones interest with other individuals around them is to give to those who ask nicely and ask less. As free market brings a lot of abundance, those who are needy can be appeased much more cheaply than those who are envy, and hence, we got welfare program.

To be frank, I'd rather see the unproductive people have bigger TV rather than letting them make more kids. It's more humane, and cheaper. Guess what? Most people that know they're not very capable either would rather have that too.

Back to the France vs British. If only both sides have realized the true bargaining positions of each, they wouldn't have to resort to such expensive 100 years war right? The thing is, the 100 years war are the most credible and accurate ways to measure ones' bargaining position. War shows which one is stronger, and hence leads to a mutual understanding of where the line of war might be.

If only we can wave our gun and scare the enemies, it'll be great.

However, the only threats that are credible are those actually done.

How do we know a cause's bargaining position? Democracy might give some light by counting the number of those who are in favor or against what we consider lesser evil. However, number counting can be deceiving. We hold this truth with plenty of evidences, that humans are inherently different.

We have difference capability and preferences, and hence different choices and outcome. It's useless to lay net in front of anything with wings. Those who are genetically predestined to be successful will get rich anyway whether through honest capitalistic means or through dictatorship.

Those who are small in numbers can hence be quite strong. Preventing the smart from making money honestly will then turn them into corruptors and dictators. When the Chileans demand to prosecute their entrepreneurs, they end up getting a dictator, the way any country that demand slavery over freedom deserves. Fortunately, Pinochet are relatively benign compared to others dictator and embrace free market giving the miraculous prosperity that the Chilean now enjoy.

Now, US government arrested his daughter for a crime of tax evasion. An act that wouldn't have been a crime if making honest money is free. The miracle of Chili becomes the model of China's moving to free market. It also helps to end communism all over the world peacefully. If capitalists fail to show thanks to Pinochet family, I don't know what would happen to all of us.

So, beyond number counting, the more accurate ways are then through skirmishes. When people cross the public's opinion line of war and we don't strike back, the line of war will shift against the coward by precedence. By fighting back, we'll then have a more accurate knowledge of which one the public would agree with.

Hence, it's very important to retaliate to what others do to us, either good or bad. It's a pleasure to serve my friends, it's also a pleasure to wipe out envy enemies that are on our ways, should my friends wish or don't mind.

When a fraudster tricks my brother over $3,900, my main concern is not to get my money back. My main concern is to get the fraudster to jail even if that will costs far more money than the $3,900. When a thief steals my money on 2001, my concern is also not to get my property back. What's just is to encourage the whole world to post any thieves conviction records on the net to prevent further larcenies.

It makes me wonder though. Why people consider it cruel to damage a thief or a fraudster' reputation? The mere acts of making honest money are punishable by income tax. When Everett O. Lasher makes an argument in court, the case leads to $5000 fine, and understandably, a suicide. The mere acts of successfully fending of ones' home from thieves lead to a life long jail term for Tony Martin. Thousands would march against WTO demanding harsh laws to punish those exercising consensual trades. In Iran, the mere acts of switching religions can lead to death penalty.

In Indonesia, new laws are being drafted giving years in prison for kissing in public. Of course, public rape during May riot are still far from being punished.

This while murderers of Vincent Chin went free without jail term. Thousands would march to end death penalty against murderers. In Indonesia, religious fundamentalists can come to a house and destroy properties from houses providing consensual entertainment with polices watching. Those people often get away or lightly punish.

If consensual productive acts are punished while damaging inconsensual forces are not, soon, all highly productive people would end up in gas chamber after the next Cultural Revolution, or what ever. Those who are left are those smart enough to be dictators enslaving the rest of us.

Prejudices reminds me of an envy old hag that's so determined to ruin my reputation for being friendly to her and her friends, after her own friendly communication. I never intended to fraud anyone or steal her money yet I got my reputation ruined. I am very disappointed to see that there are people in the world that want to bring me down more than they want to bring down a thief.

I have tried to resolve the issue privately by suggesting to that thing that she's really not important enough for anyone to pretend to be her friend. Moreover, I didn't need her as a friend. All this was just a damage-less misunderstanding caused by her own friendly communication which I could simply publicly straighten out. At least, it used to be.

However, that vermin really wished to get the issue public telling lies that she never communicated with me, possibly to boost that things' feeling of importance her genes deny her. Well, if she got so mad over a few friendly introductions, I can only wonder what that thing would do when it finds out that her true envy natures are revealed to 55000 newsgroups several times. It'll happen again and again whenever I feel like.

Hence, just look for "envy vermin" on the net to find out what's really going on including what she said privatedly. Let the public decide who are more honest, rational, scientific, and straightforward. Let the market decides which one are worthy and who are worthless. It's a great mistake to ever consider such thing as a friend, a mistake no body should do. It's her kind that turns people of from making money productively.

Hopefully we can undermine public opinions against all form of envy motivated lies and prejudices. At the end, we'll greatly weaken laws against victimless crime and easily out compete all envy people out of the gene pool. That'll ensure that the free fair market competition would reign over war when all lies and prejudices against those more successful are gone.

Now that being said, I want to move all jobs that can be done online to Asia, especially, copy writers. Take advantage of the value difference and leverage like hell is how we all make money in any system. Who's with me?

Free market is all merciful and all compassionate. At the end, even those that oppose free market will benefits from free trades.

```

Guys, I've got Mint 1.15.2, with an 80gig Maxtor IDE drive.

First partitions are all TOS, 1gig limit partitions. (well, "H" is u, ext2)

What do I need to do to create/use the rest of the drive under MINT (ext2)? Lots of space there, going to waste. :)

I've got HDDriver v8.15 here.

If there is a howto or FAQ, point me to it and I'll look it over.

Thanks!

PS Oh, its a CT60 equipped Falcon, TOS 4.04, 256 megs SDRAM, etc,...

Is there a FAQ or howto on setting up the EtherNEC with MINT?

I'm waiting for the EtherNAT, but seeing as how its delayed, I'd like to
go ahead and at least use this since I have one.

I've got it working with STing under regular TOS, but I'd really rather go
with MINT and MINTnet since thats the environment I use and prefer the
most.

Thanks!

As far as HDDRIVER is concerned you should ensure that the partitions you are going to create a Linux-compatible ext2fs on have the 'LNX' partition type.
You can change a partition type with HDDRUTIL, as explained in the HDDRIVER manual.

Ronald,

I just set up an EtherNEC under EasyMiNT. I am able to ping my router and external ip addresses. That is about as far as I got.

I use a 192.168.0.xxx address and my router is 192.168.0.1 and the Falcon 192.168.0.7. You may have to modify the following to fit your internal network. Also make sure the ne2kenec.xif is in your /c/mint folder.

I modified the following files

/etc/sysconfig/config.if

modified or added this line

```
en0 192.168.0.7 192.168.0.0 255.255.255.0 192.168.0.255
```

/etc/rc.net

modified or added the lines just before the "adding defaultroute:" section

```
if [ -f /c/mint/ne2kenec.xif ]; then
    echo "configuring EtherNEC..."
    ifconfig ne0 addr 192.168.0.7 netmast 255.255.255.0 up
    route add 192.168.0.1 ne0
    route add default ne0 gw 192.168.0.1
fi
```

You can use vi or pico to edit the files. Make sure to backup the files before modifying in case something goes wrong.

If anyone else has anything to add, please do.

Rory

Thanks for the detailed "walk through" Rory. I'll try it out in a couple
of days (got to work all weekend).

Thanks again! :)

Yeah, I am re-installing my Mintnet setup and will need to get the EttherNet
part of it working. From what I remember, it did not take too long to get
things working properly.

How big of a partition can this rpm program produce? I was thinking that 2 GIG
was the max.

Hey Edward. Well, I've not tried it yet (work! keeps interfering with my
true job <grin>), but I'm assuming like 'Nix, the 50-60 megs I've got on
my Maxtor HD shouldn't be a problem.

Unless I've got that wrong guys?

A typo I suppose. It must be ne0

Mine looks likes this:

lo0 127.0.0.1 127.0.0.0 255.0.0.0 127.255.255.255
ne0 192.168.1.4 192.168.1.0 255.255.255.0 192.168.1.255

Do one really need to edit /etc/rc.net?
Anyway on my setup I haven't touch rc.net at all, which is BTW located
in /etc/rc.d/ on my setup.
The default route is set in /etc/sysconfig/defaultroute

Editing with pico or vi isn't quite necessary. These editors aren't
not that userfriendly, especially for those who never have touched
such an editor before. Qed or Everest will do the job too. Only you must make
```

sure the files are saved with Unix style line ends.

No that should not a problem at all. I have a Western Digital 80-gig and I am
not using nearly what I want to, but I was able to increase my partition size
from what I was using on my 2-gig Maxtor drive.

Does anybody know a place (Europe preferred becasue of cost of
shipping) where I can buy SCSI to IDE adapter that is 100% working in
my MegaSTE (I have the original Atari SCSI host adapter in my MSTE)?

Thanks,
Joe Iron

I have seen those on the Nwet on various computer sites, but I am not sure if
it would work on the MSTe.

It may not work because the MSTe has no full-featured SCSI bus, i.e.
only certain SCSI commands are supported. If such an adapter works at
all one will still not be able to access more than the first GByte of an
IDE drive. With the MSTe's host adapter one cannot access more than the
first GByte of a SCSI drive, and the same limitation will apply to IDE
drives connected by an adapter.
It's probably more sensible (and maybe even cheaper) to get a used ICD
Link or LINK96/97 and connect a SCSI drive to it.

Since I don't know Hantz I suggest that you just send them an English
email. They have English web pages, so they are obviously prepared to
receive requests from customers abroad.

What should I do, if my Mega4 gives me two bombs if the blitter is
enabled? If blitter is disabled, the system works well. Is there a
program to check the Blitter? Where the blitter located on the
mainboard?

Thanks in advance,
Joe Iron

Hello

If this were my machine, the next thing I would check would be auto folder, followed by memory. I am not sure where you are in the boot process, but something tried to write to location 0 four times, either an auto folder program that should not, or part of TOS that should, and did not find anything there.

If you use a boot selector program, which is a very handy thing to use, set up one selector that loads nothing, no auto folder programs and no accessories. That will help to distinguish hardware problems from software problems.

Jim

My boot selector is Xboot which cannot be loaded since it uses (at least tries to use) the blitter.
If I boot into plain TOS : after playing with the desktop (opening and closing menus) the system suddenly crashes, when the blitter is on from tos. But if I turn blitter off from tos, I can use my computer, no problem.

hey , i will try to assist ,
do you use any additional acc's or operating systems or desktops ?
if we eliminate everything and revert to the gem desktop does this bypass
your trouble?
i had troubles my self i was forced to buy new blitter chip and new mmu
chips.
i have extra chips for sale to you , interested?
there is nothing worse than an atari that appears ok and once trying to
boot the disk -bombs- then returns to normal.

A friend of mine has had his hard drive die inside of his ST Book. There's a few questions that I hope some experts here may be able to answer.

Do you know by chance if the format of the drive is the same as the regular ST or if it is the same as the TT/Falcon?
Since the drive is IDE, can any drive be used in it or does it require certain models?
What means will the drive need to be formatted and with what software is recommended?

Appreciate help anyone can give to answering these questions.

Regards,
Glenn Bruner

Hi, Glenn!

TT> Do you know by chance if the format of the drive is the same as the
TT> regular ST or if it is the same as the TT/Falcon?

AFAIK you can take a Falcon internal HD and put it into the STBook, it should work flawlessly.

Due to the missing Floppy drive in the STBook you should partition a new HD in a Falcon (or an ST with additional IDE-interface + 3,25"->2,5"-adaptor).

TT> Since the drive is IDE, can any drive be used in it or does it require
TT> certain models?

You should take care about the height, must be below 10mm to fit into the STBook case, if I remember correctly.

TT> What means will the drive need to be formatted and with what software
TT> is recommended?

You need a hard disc driver that supports the Atari IDE interface, it comes with partitioning and installing tools. Best choice IMHO: HDDriver by Dr. Uwe Seimet.

I just plan to replace the (working) IDE drive by a CF-Card, have ordered an adapter that fits within the STBook case. CF-Cards offer enough space for Atari applications, can't headcrash and consume less energy (->longer battery life). Plus reduced seektime ;-). And they are cheaper than standard 60Gig 2,5"IDE drives.

Regards,

```
          Alexander

Alex,

Thanks for the information and tips.

Do you have a link to the information about the CF-Card and adapter?

Glenn

Hi, Glenn!

TT> Do you have a link to the information about the CF-Card and adapter?

Well, any normal sized CF-Card will do. The adapter should be something like:

<http://www.bebensee.de/shop/k002u001s001.htm>

But I guess you'd prefer some local dealer...

Regards,

Alexander

Thanks for the info.

I haven't seen anything like this where I'm at (California in the U.S.). This will help me locate something a little more local for me.

Regards,
Glenn

For sale:

The Atari Compendium - books, volume 1 and 2 (as new, excellent condition).
+ a book on AES (can't remember the name of the book, I'll look it up today).
$25 + freight for all of them (3 books).

HiSoft C Interpreter - software, including a big manual/book and disk.
$25 + freight.

Lattice C - software, including 3 comprehensive books (programming manuals/references)
and disks.
$25 + freight.

Or buy everything for $50 + freight.

Freight cost depends on where you're located. The books are quite big and heavy, especially
the Atari compendium, so the freight cost will probably end up around $25 (I'm guessing,
will check in detail).

Please email atari@mhc.se for more information.

Kind regards
Mikael

I sell the following software for Atari:

--> Cubase Audio Falcon - including dongle, floppies, manuals and box. Everything original in good shape.
$75

--> Interface (pro resource editor)
$10

--> NVDI 4
$10

--> Extendos Pro
$10

--> HD-Driver
$10

--> Dig-It (a sampler/tracker for Falcon 030 and STe)
$10

--> Nevada Cobol for the Atari, including a comprehensive manual. And a big book on the Cobol programming language, which I bought separately. I have a picture of these which I took with my mobile camera. I can email it to you.
$25

Add freight from Sweden to the price. The freight cost depends on where you're located and how many items you buy. If you buy more than one item then I'll give you a discount, no problem.

Please email atari@mhc.se for more information. Don't forget to tell me where you're located, so I can calculate the freight cost.

Kind regards
Mikael

I had a ST that did something similar. I found out it was a loose chip. Have
you tried pressing down on all of the chips of the computer. Also you might
try booting up the computer with nothing loaded (acc,etc.) Just do a plain
boot. It may be something in your boot process that is causing the problem.
Many many times I have had to replace desk accessories because some part of
them has gone bad.

It seems that cleaning the motherboard solved the problem (with new
blitter). Maybe there was a shortcut (caused by dust) somewhere?

I thought PC drives were different somehow, oh well, I'll see if I can
find one.  I think it is ignoring the HDD, as I just get a basic
desktop, I'll have to attack the drives with my voltmeter and see what
is/isn't there...

Update, I read on the AtariAge forums that someone else has had similar
problems with both drives not working, theirs turned out to be a stuffed
HDD. Since the HDD and FDD share IRQ's (or something), that also kills
the FDD. I pulled out the HDD, took off the jumpers, put them back on,
now everything is back to normal! So far.. 8-).

Nothing like oxidizaton to bugger your day. Get it quite often with
SDram and DDRSdram. Usual fix is to rub the edge connector with an eraser.
Good to see it's working for you, nothing worse than a faulty Falcon.

Mark

Stopped working again 8-). Copied almost everything to my PC yesterday
before it crapped out, currectly copying everything from my 850Mb SCSI
drive to the PC. It's a real pain, I only have 1 monitor and it's a
pain to swap over, and for some reason, the Falcon keeps complaining
that the PC drive is full after a while. Only has about 55Gig free.
Tried it with my laptop with the 2 Gig drive, 1.7 Gig free, copied 28Mb
and stopped again. Grrrr!

And if that does not work, just get a new floppy from an Atari dealer like I did. They modify PC floppy drives to work with an Atari.

Hi Richard!

If you just intent to copy all the data to the PC then I would recommend to connect the Atari HDD to PC bus directly and use ARAnyM to copy the the data (http://aranym.sf.net). Read the documentation on how to e.g. create a complete HDD image and run ARAnyM so that it would directly boot from the image.

I hope this helps a bit.

STanda

Hi all,

They still make 1.44 floppy drives with solder 'jumper' pads for DS0 and DS1. I just picked one up at the local computer show. Here is the specs:

Alps Electric DF354H (121F) 5v 1amp date code 05-02. They have the small rectangular push button. This one happens to have a black faceplate.

This should probably added to an Atari FAQ somewhere. If you have access, please add it.

I will try and find a few tomorrow at the show and modify them for Falcon use. Anyone interested in one please email me.

Rory McMahon

I read somewhere that problems are most likely to happen when connecting
```

parts are of different materials- helped by the the humidity in the air,
an electrochemical reaction takes place (i.e two halves of a contact
behave like a miniature battery) which results in an insulating layer
being formed on one half of the contact. Putting a RAM module with
tin contacts into a socket with gold-plated contacts (or vice-versa) was
stated as an example of what should be avoided.

I made some investigations:
The drive itself is OK. I checked in the MegaST. The connection between
the drive and the motherboard is ok. So the problem is on the
motherboard somewhere. Any ideas?

The problem I have is that the Ataris IDE drive is 2.5" and I don't have an adaptor, and the other external drive is SCSI, which I don't have in the PC either. I could of course write a CD, if I had a SCSI CD writer, or use my 1Gig CF card and transfer the data on that, but the only CF-IDE adaptor I have found is for 3.5", I need one for 2.5"
AAARRRRGGGGHHHHH!!!!!

Transferring via serial, slowly. Continuing the copying when one of the computers complain about the drive being full....

I actually have 2 networking cartridges, but they don't seem to work
with the Falcon (can't remember if I tried them on the STe)

Local computer stores, especially Micro Center or Fry's should have a 2.5"
to 3.5" IDE adapter, complete with power connector. I had several but
I've since given them all away to very happy recipients ;)

Thanks,
Mark

And once you're done with that falcon, if you want to sell it, let me know ;)

The domain portion of my email address is "atari-source.com" just for clarification on removal of the spamproofing.

Thanks,
Mark

Where abouts are you? I'm in New Zealand. I solved the problem with my
hard drive, replaced the 64Mb drive with a 1.4Gb 8-)

Kia ora Mate;-) just caught up on the thread again. Where in NZ are you?
I am from Rotorua myself, living in Melbourne now.
Good to see the machine is running again.

Mark

Paraparaumu.  I think I'll see about getting a SCSI writer 8-).  Almost
finished copying, just a couple of hours per day 8-).

Richard, are they EtherNECs? If so, the EtherNEC I have has worked fine
with my:

Mega ST
Mega STe
Falcon

No, they're Lantech systems LT101. They have a BNC connection to the network and a jumper, don't have any info on them, so it could just be a jumper setting...

I didn't think that the Falcons Printer port was cut down that much if any.

There are several Hardware devices that uses the Falcons Printer port.

THe ColorBurst HandScanner by Migraph uses the Printer port.
There areSplitters that use the printer port. There is a Falcon to PC program
to transfer files that uses the Falcons Printer Port.

There are other hardware devices that use the Falcons Printer Port.
Not sure how cut down it is. Never knew that it was cut down. I always thought
it was compatible with a standard PC Printer Port. But some of the Pins were
re-arranged.

The Falcons Printer Port is BI- Directional as well, to the best of my knowledge.
And so is the TTs, AFAIK.

So, I wouldn't say that its Cut Down.

The problem is simple, there just isn't any programmers that will take the time
to write Drivers that will allow a parallel Iomega Zip drive to work on the Falcon.

However, seems I remember some type of drive like this that did work on
the Falcons Printer Port using special software. Seems I read about it in
CSAST, a few years ago. But can't remember anything more about it.

You could try looking at any Atari ST-Falcon Web Sites that have info on
Upgrades, Special Cables, and Using other storage methods than a hard
drive.   There should be something on the Net about using a storage device
on the Falcons Parallel Port if it has been done.

You may have to do some digging though.   Some Atari CDs may have some
Info on it.

There's no difference in which pins are connected on the Falcons printer
port when compared to the ST(E)s, TTs, or MegaST(E)s. There are just the
bare requirements to make it work, namely a GND, D0-D7, /STROBE and BUSY
control lines.

>There are several Hardware devices that uses the Falcons Printer port.

ParCP? Works just fine on an STE, with the exact same cable. Came in very useful for transferring stuff as it managed about 30KB/s, compared to 5.7KB/s using the serial port[0].

Not rearranged, just not implemented.

>The Falcons Printer Port is BI- Directional as well, to the best of my
>knowledge.
>And so is the TTs, AFAIK.

And all other Ataris.

>So, I wouldn't say that its Cut Down.

It is. A large number of status lines are ignored because they aren't connected.

>However, seems I remember some type of drive like this that did work

A very quick Google session turned up this thread, which very much mirrors this present one:

<URL:http://groups.google.com/group/comp.sys.atari.st.tech/browse_frm/thread/77bc474d91865f9c/8e5c9f77b67dd5b4#8e5c9f77b67dd5b4>
or
<URL:http://tinyurl.com/92g9f>

>Info on it.

If you'd like a refresher, have a look at:

<URL:http://bales.online.fr/atari/>

You'll find some interesting information in the files section, some in the Quick FAQ, and some more in the other files. Para2000.zip, for instance, contains a nice bit of info about the parallel port on Atari machines.

[0] Modified so it ran at 57600bps, as well as 38400bps, and the slower,

but normal, rates.

```
Regards,                                        And have a Happy New Year
   David Bolt

PARCP also works great on my Hades060. I ordered a special cable from the author. Nice program.

HOW FAR TECHNOLOGY MOVES FROM TALK TO ROBOTS,

Would you Like To Know How The Electronic Devices Understand When You Talk to Them, And How It Works To Speak Spanish?

Because spelling words and names are common in English, Software have been developed to code names based on how they sound. Searching and matching is done by converting a word or name to some phonetic code. Phonetic encoding technology is also used for the command voice in electronic devices like cell phones(to make calls), answering machines(to select menu options), toys, cars(for security),

house(to control the lights) and a lot of more applications, It is why when somebody order to the cell phone " office" the cell phone make a call to the office, or the lights turn on when you say "lights", etc.
Some of the best video games come in Spanish
Learn Spanish reading in English
I have exciting news for anybody who wants to learn to communicate in Spanish. You can get a flying start and begin communicating in Spanish in 15 days or less it depends of you. In fact, with just 125 Spanish words (75 key words and 50 most common and used Spanish words) anyone can communicate in Spanish.
Just 26 letters make all English literature and 75 Spanish key words are all you need to begin communicating effectively in Spanish, these are:
- Alphabet(26 letters)(a, b, c, d, e .... x, y, z)
- Three articles(el, la, los)
- Pronouns(7)(I, you, he, she, It, we, they)
- Prepositions(18)(a, an, from, of, with, ... in, on)
- Verb to Be(3)(am, are, is)
- Numbers(0-9)(zero, one, two .... nine, ten)
- Interrogatives(8)(what, who, ..., how, whom)

Combine these 75 key words as a communication multipliers to make your learning time productive and create real usable Spanish output.
Now anyone can speak Spanish with "Spanish By Myself" guide. This fascinating guide makes speaking Spanish as easy as speak English, just need to know read in English, yes, read in English and learn the correct Spanish pronunciation of the most used key words that give you the most strong communication skills

AMAZINGLY, with just 75 Spanish Key words and 50 most used common Spanish words, you can actually make over 85,000 Spanish sentences and say just about anything you will want to say in Spanish.

Let me give you more examples:

REMEMBER: Read the "pronunciation" sentence in English It will sound in Spanish.

ENGLISH SENTENCE : Good morning How are you?
SPANISH SENTENCE : Buenos dias como esta?
PRONUNCIATION : Boo_n_oz d_us Koh_moh ess_tah?

ENGLISH SENTENCE: My name is Ann, What is your name?
SPANISH SENTENCE: Mi nombre es Ann cual es su nombre?
PRONUNCIATION : Mee nohm_breh ess Ann,
Kuh_al ess sue nohm_breh?

ENGLISH SENTENCE: I would like to be your friend
SPANISH SENTENCE : Me gustaria ser tu amigo(a)
PRONUNCIATION : Meh goose_tah_rih_ah sehr two
ah_mee_goh

ENGLISH SENTENCE : your son likes to play ball
SPANISH SENTENCE : a tu hijo le gusta jugar pelota
PRONUNCIATION : ah two ee_ho leh Goose_tah
Hoo_gahr peh_loh_tah.

ENGLISH SENTENCE : The party is in my house
SPANISH SENTENCE : La fiesta es en mi casa
PRONUNCIATION : Lah Fee_ess_tah ess n mee kah_sah

ENGLISH SENTENCE : I want a glass of water
SPANISH SENTENCE : Yo quiero un vaso con agua
PRONUNCIATION : yoh kee_eh_roh oon vah_soh kohn ah_guh_ah

It isn't fun, you will find a lot of more examples inside the guide but the best of the best is that you will learn how make your own sentences, isn't great!, I will teach you the 75 Spanish key words and the 50 common and most used words plus hundreds of words for specific conversations with the pronunciation of all of them, and how you can combine them.

Also you will learn good manners in Spanish, the months of the year, the days of the week, colors, words to use at the restaurant, at home, at school, at work and much more.

Don't think to much about it, there are so many people who want to learn speak Spanish and I'm sure you don't want to stay behind, there are a lot of opportunities for the people who speak English and Spanish, not only for jobs, but to do new friends, to do business or just to know speak Spanish and be more competitive in this world. Take your future in your hands, nobody is going to do it for you, you have to make decision by your self, and this is a good one.

Get your Guide now for a half price and you will receive the bonuses

What is stopping you?
Look, I do know that you are reading this message, it is because you want to learn speak Spanish and of course, you do realize that you need to study to achieve your goal. So there's no reason not to get my Guide, you just have to read in English and then the Spanish flow in your mouth naturally without effort.

ORDER NOW at www.spanishbymyself.com

Please forward this to a friend. It will highlight his day. Once forwarded, look for the complete information about the guide at this address: http://www.spanishbymyself.com This Guide is even better!

Hello all

After I finally got the bits to make my atari Falcon complete I seem to have a screen resolution Problem.

It starts in a interlaced 640 *400 2 colour mode and works fine at that.
If i change to any resolution I get 4 bombs after the screen change.

Are there any places to start looking, I did move the Auto folder but it still started up the same 'start up' programs.

Thanks for any help

My Email is: brookefamily at mikeandtish.com

Don't know about your video problem, but try renaming your Auto folder instead of moving it - also disable any accs and/or cpxs.

Create an empty Auto folder on your boot drive and add progs from your original folder one-by-one, bearing in mind that some might need an accompanying config file or acc to make them work properly, or might need to run in a specific order.

Are you running MagiC/MiNT/NVDI?

Because the desktop is in French I am not sure of the OS, but I believe it is just the standard GEM desktop.

I am trying to find a way to reset the language to English, is there an easy way to do this?

do you have the same problem if you don't boot from hard disk?
try booting without hard disk and change resolutions from your desktop (showing
two floppies icons)

Hi Mike.

Depends on whats wrong with it. Alex Yu at ATY Computers, Rodolphe Czuba would be 2 right off the top of my head.

What seems to be the problem?

I would think B&C Computers, ATY Computers or Best Electronics would still be repairing those. A guy in our club took his Falcon to some local place and has not gotten it back.

I read about CF cardreaders that have a SCSI interface. How about
connecting such a device to my Falcon, insert a 1GB CFII, boot from it
and record with CAF audio to it? Has anybody done that? Will this work?

Question mark,
Karsten

This should work, at least as far as using the CF card as a hard disk
replacement is concerned. Atari users have used different SCSI and CF
card readers in the past with HDDRIVER as hard disk driver.
I sometimes use an IDE CF card with my Falcon.

Hello all

Thanks for the assistance upto now on different issues....

I brought another Falcon from Ebay which said it was 32 Mhz, when I run Diags it says 16 Mhz, but there is a small LED on the top of the Falcon and when I removed the cover it runs back to a small 'box' with several wires coming from it (maybe 10-12) two of which seem to head down to the 68030.

Does anyone have any clue (from my description I'm sure its not easy) what this might be and if it was a clock accelerator how or what software might be required to use it.

Regards and thanks in Advance

Uwe,
 Did the issue with the "triple" readers ever get solved. I have hesitated
in bidding on those that came up, as I gather no one got them, to work.
   Dave.

I am sorry, but I cannot remember this issue right now. Since I cannot
remember it, it was most likely not solved ;-).
Can you explain the issue again, please?

I would not mind having such a device for my STe, but why not do the connection via the cart port. It would be so much easier to use and connect. I use an Ethernet device though the cart port and it has been working out great so far.

I just think that no one could get the MicroTech triple card readers (Like
the one below) to work with HD Driver. (or any other driver). Not sure why
(3 Luns perhaps). Any thoughts on how we could fix this? Buy one and ship it
to you perhaps?.

Ide by cartridge port exist.... but it's not a very good solution because if
we use port cart, we can't use other interface as ethernet, vidi st, music
capture etc.....

Bastien

You can't use the existing drivers with a cartridge port driver. The
cartridge was designed to be read only. Writing is a fiddle and so
slow(ish). Possiblt quick for 10 Meg ethernet, but I think it might slow
down a moder drive...

Well, I could not give any guarantees in such a case that I would be
able to get HDDRIVER working with it. Since HDDRIVER supports any SCSI
device in principal, and many devices have been tried with HDDRIVER,
there must be something special with devices that do not work out of the
box.
The number of LUNs is not relevant in general, but HDDRIVER only
supports two LUNs. It could support more, but there was never any demand
for it.

Note that if something does not work with the Hades (Lonny Pursell tried
such a device with the Hades) it does not mean that it does not work
with a regular Atari. The Hades SCSI port is not really compatible with
the SCSI ports of TT and Falcon. I would not be surprised if some
devices work fine with the TT and Falcon but do not work with the Hades.

Obviously not all SCSI card readers will work. Are there any
recommended models that will work with the latest HDDriver? Is there a
chance to get one from german ebayers? I guess only used devices will
be available. Is there any other chance to get a CF card "mounted" as a
SCSI drive (maybe a SCSI->USB adapter or SCSI->IDE adapter and then
using an IDE card reader)? SCSI drives is a must, since CAF only
records to SCSI drives. What about the CF data throughput compared to a
hard disk (reading and writing)?

Somebody tried using a SCSI CF reader with a plain ST and an ICD host
adapter? Does it work with the standard ICD drivers?

Thanks,

I did try the triple card reader on my Falcon, and it did not work.
My single card reader works fine.

I use the MicroTech single card reader as the only "hard drive" on my
 STe. I use the ICD drivers with the Link II.

I believe you can do this from the desktop.inf file, but I can't get my tests to work on an emulator. If you save your desktop, then open the desktop.inf file, you'll find a line like this:

```
#c7770007000600070055200505552220770557075055507703111103
```

This specifies the colours (three characters per colour for 16 colours), then the double-click speed, key-click, bell, key delay and key repeat.

I believe the one which I have changed to # below should be changed to 0 to kill the click:

```
#c77700070006000700552005055522207705570750555077703#11103
```

But, as I say, my tests didn't work out so well. I can investigate more later if required.

The other option is to write a small program to write #1 into $484, or there's probably a BIOS call to do the same.

Cheers,

Stu

Umm, if the control panel is available (drop down menu/ACCs) then you
should be able to just click the beep off.

Just curious - what game(s) are you playing that the beep is present in?
Most self-booting floppy based games don't do that...

You're right, stick with a "real" Atari. :-)

Because of that though, you should be able to access the control panel
from the ACC drop down menu and turn the sound for keyclicks off.

HTHs.

Hi all

I'm desperately looking for a software running under windows 2k/xp
environment and capable of playing my old *.arr and *.sng files compiled
several years ago with my "late" Atari 1040 ST. I tried downloading Cubase
SX but I can't get it to start on my XP equipped portable. Furthermore, the
floppy where the files are stored are formatted with the original Atari PC
and I can't even get them in my Windows PC,
Any hel welcome

Thanks in advance

Dino

Yes, that is the best way. That is why I still my original 520ST, 2 1040ST's
and a STe.

>Because of that though, you should be able to access the control panel
>from the ACC drop down menu and turn the sound for keyclicks off.

This is the way I would go. Just use a simple ACC to turn it off.

Sorry, but I can't find any control panel, the drop down menus (german
version of GEM/TOS) only contain preferences about file managament etc.

Then you may have to install it.

Google can help, if nothing else works. Any FTP site with Atari programs
has both XCONTROL and ZCONTROL, and a large variety of tools, bells and
whistles that run on them. FTP chapelie.rma.ac.be or FTP
barnone.citi.umich.edu/atari, and look under utilities for XCONTROL and
ZCONTROL, and use whichever you like better.

```
Jim

Hi Rory,

Excuse me, but Geneva + Neodesk is very expensive too ;-) (130 GBP)

Geneva is it compatible with long name ?

I have not stability problem with MagiC 6.2.

See tou,

Bibou.

I have a working ADSpeed 16 currently in a 520ste, with the driver
disks. I would let it go for a fair price + your 8MHz processor, if
people might comment what fair is since I don't know...

Hello, William,

You certainly have a lot of problems, all at once. One of them is either a bent pin on plug in memory, involving the very first byte of memory, or a bad connection to the very first byte of memory. The solution is to take it out, clean the contacts with a pencil eraser, and put it back together.

Memory is not that hard to find, using UseNet and I think it is alt.computer.memory. Post a want list, and someone will have it. I got enough 16 meg 30 pin sticks to stock an old memory card, and I found enough 256 meg 72 pin memory for newer memory cards, with instant replies to my wish list.

As to replacing the nvram chip, I would advise the bigger hammer approach, and cut through the leads with whatever passes for a Dremel tool or a

Do-More there, take off what is left using lots of rosin flux and solder
braid, and put a socket there.

Jim

WilliamWong <bab14a@yahoo.de> writes:

: Hi,
: Been some time since I used my falc.
: Last night, after downloading a new SCSI-ethernet driver via Windoze, I
: tried to transfer over to my falc. On powering up the falc, I was
: greeted by a blank screen.
: There was slight click when I pressed the reset button but still blank
: screen.
: Slowly, I removed devices from it (removal of HDD and floppy as well)
: but blank screen persisted. Last item was to replace the 3rd party 14MB
: ram card with the original 4MB ram card, I finally got my Fuji logo :-)

: However, my nvram was reset, clock reset and HDD still cannot be
: detected.

: The question is
: 1/ Other than items in nvram setup via Bootconf, is there any settings
: that will affect my 14MB ram and HDD settings? It seems to be set to
: default and cannot see the extra ram (I believe the ram are OK).

: 2/ I tried HDDriver 8.1 demo and it cannot see any HDD. (also my
: original Atari HDD - conners I think - cannot be seen) - is there any
: tools that will see what is on the IDE bus?

: 3/ My nvram seems to be going off after a couple of hours. Does it use
: batteries or what? Anything that I can change?

: Sorry if I sounded like a newbie.

: Hope someone can give some advice rather than to rebuild the HDD and
: get new 14MB ram (I think it is difficult as they are so obselete now).

: Rgds
: William

I use ScanX Pro to run my UMAX scanner. YOu may want to goto the Homa Systems website and talk to Nima. I am not sure if the A4 scanner is supported or not. Their URL address is below.

Does it have a 360k (Single Sided) or 720K (double sided) disk?

If it is double sided the you should be able to read any 720K (i.e. non extended format) disk.

Howevr Microsoft seem to have messed Windows/XP up and disabled support for formatting such disks. It will still read and write any formatted on a previous version of windows, but won't format them using the GUI. Unfortunatly it worn't read any formatted using the desktop in an ST-FM either.

To get round this try :-

```
format /t:80 /n:9 a:
```

from a command prompt. However the biggest problem with Atari disks is that many are formatted with non-standard formats to squeeze more data on. Unfortunatly these just don't usually work in a modern PC drive:-).

Dave;.

That is so even if it's an early STFM model, though the PC won't be
able to read disks formated on the Atari if it runs TOS <1.4.

If the disk is double-sided and has the normal 9 sectors/80 tracks,
you can use DISKMOD.TOS together with BLOCK0.DAT to write a new
PC-Atari-compatible root sector to it on the STFM. These should be
available from the usual Atari sites, but if necessary I can email
them to you - they are under 8kb before MIMing - less when ZIPped.
Just send me your adddress and confirm you can unMIMe and unZIP
files.

Regards, /Peter/

Trouble is you need to get these onto your ST, so you will need a blank
floppy that can be read on both PC and ST.

True, but the original question was can an ST1040FM read PC disks. The

answer is yes if:-

1) The ST FM has a 720K drive
2) The PC disks are 720K disks (not 1.4)

Is there a way for formatting a 360K disk on a PC so it can be read on an
ST?

Dave.

I have been happily running the Hatari ST emulator for unix
using it's ability to translate GEMDOS calls to present a
unix directory inside the emulation as though it were a
formatted hard disk partition (this is handy for getting
files into the emulated world).

Hatari can also use a hard disk image. I created a file
containing zeroed bytes...

```
-rw-rw-rw-   1 ball  users   10653696 Nov 29 20:40 st412.img
```

     ...but it doesn't show up on the ST desktop at all. I'm
thinking that I will need to partition it and create a GEM-
DOS filesystem on ("format") it. Can someone point me in the
direction of tools that I can use to do this? (It's a pity
that Atari didn't put that functionality in the TOS ROM ;-)

A short note: This will only work if the emulator provides an XHDI
compatible interface, so that HDDRUTIL can access the "sectors" of the
hard disk image. The Hatari emulator may support XHDI (there is no
technical problem for an emulator to support it, in particular because
it is well-documented) or it may not. The documentation should provide
information on this.
Provided that one has an existing Atari-compatible hard disk drive
connected to the UNIX machine running Hatari it should be possible to

create a hard disk image containing the data of this drive with the
standard UNIX tool 'dd'.

Curiously it didn't even come with a man page. Given its
general feeling of comleteness, I would not be surprised if
it did. Am I right in thinking that the demo package does
not include HDDRUTIL?

US> Provided that one has an existing Atari-compatible

I never had a hard disk on any of my STs. Is it reasonable
to suppose that dd would work the other way too: coping an
image file onto a physical disk (that has enough sectors)?

You mean the HDDRIVER demo? HDDRUTIL is included, in other words, you
can run a test with it.

> I never had a hard disk on any of my STs. Is it reasonable

Yes, dd can do that as well.

Hi All,
             Does the VME adapter board really need to be soldered to the
main board on a Mega STE?

             I'm trying to get a graphics card to work, and I noticed the
VME board is only sitting in the slots. It works on another Mega STE, and
that one is fully soldered to the main board.

             Yes I know it looks obvious, but on closer inspection there
doesn't seem to be any electrical connection between the two.

              Thought I'd ask you all before I commit to soldering
dangerously close to other components.

          Thanks      Mark.

Hi Steve

Thanks for the reply.

So, in theory it doesn't matter if the connector is fixed to the main board or not, as you say the signal goes through the ribbon cables anyway.

There are signs that it was once soldered, and most of the solder removed. The two lugs just sit in slots on the main board, with the casing holding it in place. The only time it could have been done is when it was returned in 1992 to Gasteiner in the UK, where I bought it, to upgrade the floppy drive to HD (which they completely failed to do incidently; myself only succeeding a couple of years ago- another story:-/

Were there some early Mega STE's that couldn't take a VME card?

I've cleaned the contacts, including the ribbon cables. Is there something else I'm missing?

Mark.

What is the best way to transfer files from the Falcon to a PC? I have done it with a null modem cable, but of course it's pretty slow. Is there any way to get faster transfer rates with the printer port or even the 8pin LAN port? My PC has the usual printer, serial and RJ45 ethernet ports.

I think you can use the EtherNEC and ftp. Its just a little bit expensive, at just over $75 or so. Its worth it, IMO. Or you could wait for the EtherNAT to come out, should be March of next year. That should offer full LAN speeds. More expensive though.

If you had a burner, you could just transfer them via CD. Just a thought.

Check out Millie Babic's website. He talks about connecting Atari computers to the Internet using an Ethernet connection. That would be the best way for transfer. http://user.tninet.se/~gcc561r/. Or try using PARCP which uses the printer ports of both computers. You need a special cable that you can either build or buy from the author.http://joy.sophics.cz/parcp/.

Since when did the Falcon have an RJ45 ethrnet port? The LAN port is appletalk You can use the LAN port as a high speed serial port..

> ethernet ports.
>

As usual the answer is "it depends on what you want to transfer". If you want to move a small number of files then a floppy disk is probably the best way. If you want to move larger amounts of data you have multiple options:-

1) Get a CD writer. I assume as the TT has an IDE interface you can use a modern IDE CD (or even DVD) writer. This is good as it can preserve directory structure. You could also use a "Superdisk" (LS120) or other large format floppy. Probably need HD Driver. This is also usefull as a backup tool.

2) Get a SCSI Flash Memory reader. HD Driver will let you read and write flash memory if its in a Microtech 2-slot SCSI flash memory reader. These crop up from time to time on e-bay. Note last I heard the 3-slot ones don't work. Perhaps Ewe will comment as to why. Watch because many sellers of this won't ship outside the US.

3) As some one else has said get an Ethernet connection. As the falcon has no ASCI port it will have to be an "Ethernec" or a SCSI Ethernet Adaptor. You can get Ethernec's from E-Bay. Probably worth getting a card as well. You can also build your own (I did, see

http://www.dwade.freeserve.co.uk/atari/main.html

for details. You will also find the SCSI Ethernet adaptors on E-bay. You might want to consult :-

http://www.anodynesoftware.com/ethernet/main.htm

for info on which ones work. I picked a couple up from a ham radio boot sale for 1.00 pound each. (about 2 dollars.) The great thing about doing it this way is that if you have broadband or similar you ST can FTP directly from the many FTP sites around the world.

4) Because the ST (and I assume the Falcon is the same) has a "cut down" printer port many PC transfer programs (that use LAPLINK) can't be ported to the ST. One that I have used and which does work is PARCP. Take a look at:-

http://joy.sophics.cz/parcp/

I made my own cable from a standard printer cable. I chopped the end off and soldered a D-25 on. Works pretty well. The registered version is really quite usable.

Hope you find this helpful,

Dave.

For the Falcon an IDE flash adapter is most likely the better choice, because it is much cheaper since hardly any hardware is required because CF cards essentially already have an IDE interface.

Any one tried any of these with HD Driver? Would they work on my STE with an
IDEAL interface?

I am sometimes using an IDE CF adapter with my Falcon and (of course)
HDDRIVER. There are also other users, e.g. with a Milan.
I would expect such an adapter to work with any IDE interface, because
all in all the adapter appears like an IDE device to HDDRIVER, provided
that the adapter correctly supports the IDE standard.

"Appletalk" not exist on Atari platform.
LAN on Falcon simple is a serial port. Not more.

(Still using Elmar Hilgarts romport interface on falcon (with DSL)) :)

My floppy drive in my ST is dying. It can read/write only one side of the disk. Does anybody know what can be the source of the problem? Can it be repaired?
Maybe this is covered in many topics, but what are the requirements of an 1.44 drive to work as a 720 drive? I successfuly replaced the 720 drive in my MegaST by an 1.44 drive from a PC. Only one jumper needed to be changed, but I absolutely don't know what is the function of that jumper.

Thanks in advance.

Early years an romport adapter was avaible, i think from woller
Berlin/Germany. I can�t say where you can get one or you can found
information about.

SCSI ZIP is easy to connect and faster.
Works fine with HDDriver.

Regards, Robert

I doubt if it will work on the printer port. It is the usual ATARI cut down job and does not have enough lines implemented to support things like scanners, zip drives, etc.

After not using my Falcon for at least 5 years or so, over the last week I have played around with it a bit. Last night, after deciding that I don't have any fast transfer methods between my Falcon and PC, that I would use PCslave and a null modem cable to backup all of the Falcon's data. Switch on the Falcon, just got the bare desktop, A, B & trash. It obviously hadn't booted from HDD. Try again, no luck. Try to find Falcon Language disk, no luck. Tried reading a floppy, complained about possible data problem on floppy (or something like that). CRAP! I noticed that the floppy hardly even starts turning before the error message comes up. Since it's been so long since I have used it, I can't remember how long it used to take before it would come up with that message. I guess I will have to go round to my parents house and borrow the floppy from my STe (assuming it's the same Epson SMD-300 drive) and give that a try.

I seem to remember having to re-write the partition info or something like that a long time ago, but can't remember if it was the STe with the LINK(?), the Falcon, or my first PC. I'm hoping that the othwe drive works, I can re-write the partition info and get it all worknig again.

The strange thing is that both the HDD and FDD crapped out at the same time, they were both working the night before, and I have used the same null modem cable before, although the PC I have connected to has changed, but that SHOULD be ok.

Is there any other common faults that stop both drives working at the same time? It's the original Conner 64Mb HDD and Epson FDD drives.

Try a blank floppy in the drive and hold down shift as you boot the
machine. It will force it to ignore the Hard drive. If the floppy drive
is faulty you can use a PC drive as long as it can be set to ID0.
I would suspect the power supply if all was well last night.

Mark

CD-Boot distros does not have Atari partitions suport compiled in (at
least last time I checked Knoppix).

Well, I believe you can see pictures at:

http://www.fujiman.com

but I timed out trying to get there just now. Rory lurks around here somewhere, perhaps he'll see this and help you out.

Hi Kevin,

Have a look here, this may help if you're handy with a soldering iron
and have some 72pin SIMMs on hand; http://www.retro.dial.pipex.com/

I can't display JPEG images with Papyrus and CT60 in 060 mode.
I tried the demo versions and my latest version (PAP X), and it's exactly
the same: instruction error everytime a JPEG appears.

Everything works in 030 mode.

I tried clean booting, and it's the same.

Any hints?

Thanks in advance

Paolo

I sometimes get errors when I boot up Papyrus X on my Hades 060. The thing
that works for me is either boot the computer under regular TOS or else boot
it in the 256 color mode. I usually run things in the 24-bit mode.

UPDATE:
I installed easyMiNT, actually I rushed an installation, but it went well.
At the first shot I had a working environment (with some glitches, 16 colours, 640x480, and my auto PRGs didn't load) but Papyrus loaded JPGs immediately.

So, I assume, it is something connected with the TOS itself, or at least, the TOS routines that are replaced by MiNT...
Now I'll dig into MiNT to see if it can accomodate my needs, so I'll forgot plain TOS problems.

who knows...

In the meanwhile, thank you guys!

Hi,

I picked up a Falcon via eBay.

It was working somewhat when I got it, but whenever I popped a floppy in the drive, it would lock up. After opening it up one of the after market mods had a loose wire and it was contacting the metal casing of the floppy.

I verified this by booting it up with the wire disconnected and it worked, (as well as a computer that old would)

I then re-soldered the wire back to the chip.

Since then the Falcon will POST, do its memory test then display 3 bombs.

Does anyone know what the 3 bombs are? I'm aware that the problem could have simply come from my soldering the wire, since the Falcon and all those chips are pretty old.

Otherwise, I guess I will have a non-working Falcon for sale.

Thanks
SJ

Depends on the mod, but I'll buy it. I've seen many of them so I'd know
how broken it is. It's crashing once there's disk access indicating that
the floppy stuff still seems to have issues or something. Without photos

posted, I couldn't tell you much though. If you take photos and post them somewhere we can all try to tell you what's going on.

Thanks,
Mark

Mark,

Thanks for the quick reply! I decided to open it up for pictures, then decided to unplug the hard drive and give it another try and with the hard drive disconnected it boots. Maybe its just age.

At one point, I did get the whole thing working and was able to make the hard drive bootable and actually booted off it.

Any suggestions on this?

I just don't have the time to mess around with it as much as I wanted when I got it, so I'll probably relist on eBay next week.

Again, thanks,
SJ

I was wondering, has anyone ever attempted to upgrade a Stacy to a color screen? With all the mods and hacks being done this could be a cool hack. Any ideas?

Hey, that's a cool idea.

A TFT with the right size, and a RGB/Composite/TV -> VGA adapter + some
wires internally. You could even make it support all 3 resolutions if
you're lucky.

I don't have a Stacy so I can't try it myself, unfortunately..

I I thought about that too :) It could be possible but the problem is to get
right TFT and cheap one :)

So then it should be possible since STACY got full ST VIDEO compatible
SHIFTER. But then I think it should have better POWER SUPPLY or more, better
batteries :)

Hi,

Check out Lilliput, they might make a screen big enough, I know they do
little 8" screens that take in VGA and composite.

If someone who knows their stuff looks at it, it'll probably be a fairly
easy fix. Just some intermittent problem somewhere on the board. Check
disconnect-ables like the ST-RAM card first.

Thanks,
Mark

Hi,

I am looking for a copy of MagiC 6 since I heard of it. For my AtariST
bought in 1986. Anybody who wants to be so kind?

You can upload to my ftp-server anonymously. Thank you very much.

An old AtariST enthousiast.

Do you think you will be more successful this time than last time when
you asked for illegal copies of MagiC?

> An old AtariST enthusiast.

Very funny! Enthusiasts do not use illegal copies.

Hello,

That is nice that you want Magic 6, but it is commerical and needs to be purchased ASH and others who sell it. If you want a nice OS that is free try Mint.

Looking to buy working ADSpeed 16 for the 1040STe.

Also looking for working Switchable TOS 2.06/1.62 for 1040STe.

And a 1.44 High Density Disk Drive kit for 1040STe.
(Or good directions on how to do this myself)

If you have either for sale/trade, contact me at e-mail below.

Thanks,
phantomm@bellsouth.net

Hi,
Been some time since I used my falc.
Last night, after downloading a new SCSI-ethernet driver via Windoze, I
tried to transfer over to my falc. On powering up the falc, I was
greeted by a blank screen.
There was slight click when I pressed the reset button but still blank
screen.
Slowly, I removed devices from it (removal of HDD and floppy as well)
but blank screen persisted. Last item was to replace the 3rd party 14MB
ram card with the original 4MB ram card, I finally got my Fuji logo :-)

However, my nvram was reset, clock reset and HDD still cannot be
detected.

The question is
1/ Other than items in nvram setup via Bootconf, is there any settings
that will affect my 14MB ram and HDD settings? It seems to be set to
default and cannot see the extra ram (I believe the ram are OK).

2/ I tried HDDriver 8.1 demo and it cannot see any HDD. (also my
original Atari HDD - conners I think - cannot be seen) - is there any
tools that will see what is on the IDE bus?

3/ My nvram seems to be going off after a couple of hours. Does it use
batteries or what? Anything that I can change?

Sorry if I sounded like a newbie.

Hope someone can give some advice rather than to rebuild the HDD and
get new 14MB ram (I think it is difficult as they are so obselete now).

Rgds
William

If you do not see any devices in the HDDRUTIL ID check and additionally
your RAM is not recognized anymore this is an indication of a hardware
failure not related to your hard disks but related to your Falcon.
As far as recognizing the available RAM and the hard disk drives is
concerned the NVRAM settings are not relevant. Some of these settings
may be read by the hard disk driver, but just in order to determine the
boot device. They do not influence the device check.

> batteries or what? Anything that I can change?

Yes, it uses batery, but it is in the chip. You could try ripping top of the nvram chip (it is made from two parts in fact), and you'll have acces to the battery. You will need to do some soldering to chcnge it.

Other possibility is to replace the whole nvram chip.

I TAKE NO RESPONSIBILITY IF YOU'LL DAMAGE YOUR FALCON.

Hi,

Why would you want MagiC?

I can think of 3 reasons not to get it.

1) Too expensive (80-134 euro).
2) No longer supported.
3) Not too stable.

Try Geneva and Neodesk, possibly available from Gribnif or Ebay. These products are also commercial. Probably will work on a ST.

Try MiNT. It's free, supported and stable. All you have to do is install it. It may take a somebody smarter to help you put it on your machine. But the results are worth it. You can return to TOS if you dont like it. And you didnt have to spend a cent. Cool.

Rock on you Atari Enthusiast...

Rory

P.S. Attached is the copy of MagiC 6. ROTFLMAO.

Attachment   : "Copy of MagiC6.zip"
Instructions : Double click to install.

Yes. It does seems the HDD is dead. When I connect a spare HDD, I can
read the spare HDD. It seems that the dead HDD may be intermitten
because trying several times I can see it in the device check but
nothing in the partition or initialise dialogbox.

In any case, I will use the spare HDD and loss all my codes :-(

It is a Dallas DS1287a chip, just replace it and problem solved. Maxim
make an equivalent too.

Well, what happened to you shows how important it is to make backups on
a regular basis. A hard disk drive can get broken any time, even if it
is new.

I do actually have backup in my external SCSI HDD as well as on my SyQuest 44. However, they are not too up to date..... since I rarely use the falc.

Hi Uwe & Peop's

How times have moved on, i recall not that long ago making a backup of an entire hard disk contents to about 50 floppies and thinking that was a mission! nowadays an equivalent size stack of DL-DVD's is insufficient.

Do you have several GBytes of personal data to backup? All my personal data, including digital photos, all of my source codes and much more easily fit on a single CD. Even all the source codes for the firms I have been working for would have fit on a single CD.
One needs more backup space if one wants to save a complete system. My complete Linux system requires more than a DVD, but why would I want to save binaries I can get from anywhere (installation CD/DVD or internet) anytime?

well, nvram needs replacement - it is dallas nvram chip, see best electronics or otjer electronics spare parts shop...
details may be found inside doitf030 faq...
also, try replacing simm(s) of your ram card, and cleaning the contacts if it was unused for longer period of time...

good luck

I am trying to resurect this Atari 1040ST I have. It worked but the video was really bad on a cold boot. Screen flipped and was unusable for about 10 minutes, then as it warmed up it got better but still was a bad video signal. I tried to get it working by reseating all chips etc and no go. I swapped all socketted chips and no go. I though, well I will just get another cheap system board! I did and both exibited a similar problem. On disk loading, each track load, or click from drive, would flip or jump the screen, but it was clear and crisp unlike original board. Also as unit warmed up from cold boot it would get less evident but still on disk loads the screen would flip or jump slightly. One thing I noticed is the drive standoffs were glued on the motherboard since the replacement boards did not have them on. The brass one was also glued on, does this need to be

grounded to the board? ie no glue! I cannot see what the problem might be,
I tried two different PS's.

Thanks

Check power supply voltages, look for bulged or leaking capacitors,
replace same. Maybe two similar power supplies.

If there was any distortion, I would suggest changing C109 thru C113 from
470pf to 22pf. Some monitor cable capacitances are too high for the board
capacitances, and those two working together create screen distortion.

These caps are on the RGB and sync outputs. No, the supports for the disk
drive do not have to be grounded. They are just spacers.

A while back I accquired a C-Lab MKX case and more resently I've got
hold of a internal C-Lab SCSI kit. In both cases I didn't get any
fitting instructions.

If anybody has a copy of any instructions for either I'd appreciate
it. If there weren't any instructions I'd like help with the
following:-

For the case I'd like to know where the dual coloured LED is wired to?

For the SCSI kit I'd like to know exactly where it sits? I know you
have to remove the termination resistors and site the kit there. The
resistors have eight pins each whereas the kit has two rows with six
and one with seven. I'm assuming it can therefore sit in one of two

positions. There is also a blue wire that needs to be connected.

I'd appreciate any help.

Thanks

U7 - Left side of this chip. It is near the SCSI connector marked Logic. AFAIK, the pins are not lifted off the motherboard. The pins are wired to the black connector for the led.

2nd leg from top - Pin 3 of black connector for led
4th leg from top - Pin 1 of black connector for led (this is the blue wire)
6th leg from top - Pin 2 of black connector for led (center wire)

>For the SCSI kit I'd like to know exactly where it sits? I know you

Hmm, the board I have has all three having eight pin with the term resistors mounted on top. The blue wire I'm not aware where this would go.

I can try to get a picture on the web if you need to see what I'm trying to describe on the board that I have.

Mark,

If you happen to know where I can get one of those
C-LAB MKX cases and SCSI kit and etc.
E-mail me and let me know.

I am looking for some type of case to recase a Falcon
and really don't want a Wizztronics Case.

I'd like to find one of the older ones that was a tower case or
you could turn over on its side. It also allowed you to recase
your stock Falcon Keyboard.
I don't remember what the name of it was. Remember seeing it
in ST Format.

I know its not the DeskTopper case.

The Color of it was similar to the standard Atari Color or a
Brownish Color.

I'm ashamed to say I don't do any soldering like this myself. Will
pass this information to the unlucky person who does.

That would be great. From what you've said I think you may have a
different version. I don't have a web site but I am going to JagFest
UK 2005 this weekend. May try to get Shiuming to take a picture and
include it with the write up of the show.

Got both the case and SCSI kit from System Solutions. I'm afraid it
was the last of each.

|I am looking for some type of case to recase a Falcon
|and really don't want a Wizztronics Case.

|I'd like to find one of the older ones that was a tower case or
|you could turn over on its side. It also allowed you to recase
|your stock Falcon Keyboard.
|I don't remember what the name of it was. Remember seeing it
|in ST Format.

|I know its not the DeskTopper case.

|The Color of it was similar to the standard Atari Color or a
|Brownish Color.

Was it the Lighthouse Tower System?   That included FreeKeys keyboard
system that used your old keyboard. There was a review in issues 27 &
28 of Atari ST Review. Haven't got the time at the moment to go
through my copies of ST Format.

Here are some large (~200kb) fuzzy pics of the wires and resistor
packs. I have a really bad camera, so hopefully you can see what I was
trying to explain.

That sounds like it, I got mine from System Solutions before the Atari arm split off.

The case itself wasn't particularly well made IIRC, but at least there was plenty of room inside for expansion. A Reflex graphics card, Magnum RAM expansion and an AdSpeed accelerator all found homes therein (not necessarily all at the same time!).

Hi,
A few days ago, I got an old Atari 1040ST from a friend. It's a great
computer for old adventure games and stuff like that, but everytime a
press a key, the Atari beeps. Is there a simple way to turn the bell
off, without removing the speaker?

Try Gemulator Explorer, from the Gemulator web page.
It worked rather well with Windows 98, no idea about XP (and special
formatted ST disks)

Cheers all...

I'll give them a go, just downloaded a number of utilities and I'll see
which one works best.

how come? i saw several tt ram cards few weeks ago on ebay...they use 30 pin simm
modules as far as i remember...
st ram would be harder to find and make your own board but not impossible ;)
but, if you get tt ram card, then it won't be important any longer...

The (commercial) HDDRIVER is by far the best. In conjunction with
MagiC 6.10 or higher it will allow large partitions (when using
FAT32 of almost unlimited size) and up to 26 devices; with older
versions of MagiC the size is more restricted as FAT32 is not
supported (and TOS can't see these partitions) but I am running a
6.4GB drive in 8 partitiions on my Falcon with 6.01.

If you don't have MagiC you might need to install BIGDOS to allow
large partitions. Note that the largest usable partition size
depends on the operating system - for instance TOS < 4.0x only

supports a maximum partition size of 512 MByte.

To true. And thanks to coda for the schematics. Will keep an eye on ebay
a little longer I think.

This was what I was thinking about, but wasn't sure it was available on
the ST
Platform.

With my Atari 130XE and 1 Meg ICD MIO, I use to UN-ARC game files into
a Large Ram Disk and run the game in Ram.

You could even copy some whole disk games into the Ram Disk and
boot it in Ram. It really speeded up some games.

Not all games worked, especially if they accessed the original disk
for info. But some games like this were altered to run in the ram

disk.

I would bet that some ST games will run in a ST Ram Disk.
Especially, file type games. And TOS games that can be ran
from the DeskTop. Of course not all games will work this way.

I just picked up a nice 520stm system.   It also came with an external
floppy drive some manuals and I have an Atari monitor plus a mouse I
found someplace else.   So finally I have a usable Atari ST, but I
find that most games require 1meg.

I would like to upgrade my 520 to 1meg and I have heard of a "piggy
back" technique which sounds easy, but has anyone here done it?
Anyone know a place I could find detailed directions?

Are there any other easy and preferably inexpensive ways to upgrade
the original 520ST to 1meg?

any help or advice would be appreciated.

Kevin

Hello.

>>I hate to say it but it would be WAY cheaper to get a used 1040ST than try
>>to do this mod!

Too true!

> I wish I could find a reasonably priced 1040 or above. Unfort in the
> USA they are few and far between...

Plenty in the UK......You could always use an upgrade kit.

I'm sure I know someone who has one for sale.....

I did the piggy back method on my ST. It worked, but was very unstable. The memory would be there one moment and gone the next. I then took it into some guy who took out all my memory chips and installed new ones hat gave me the the upgrade. It has worked well ever since. If there is someone in your area that can do this, then I would buy the chips (which are cheap) and have it done. The other way is to just buy another Atari. I ended up buying a 4meg STe real cheap.

Now that i think about it, back in those times, 4megs SIMM were
costly; that is why i choosed to build a socket board.  It would be a
lot easier to just solder directly one 4 meg (or 16) simm.

Benoit...

Note that another (and better) alternative is to use MiNT instead of
Big-DOS in order to get support for large partitions. MiNT requires more
memory than Big-DOS, though, but provides many useful features.

Anybody offering? Thnx.

Please mail me if you can be so kind to share your original copy. Much
appreciated. Will do what I can in return.

Hi.
I recently bought a 2nd JAZ (1GB) drive (I already have one connected to my CT2 Falcon) to connect it to my WinXP system. What I want to do is transfer data from the Falcon to the PC to burn my CAF songs, audio data and system backups to CD (I have no CD burner for my Falcon). JAZ disks seemed to be a cheap (today) and simple solution for this purpose.

First surprise:
WinXP, Adaptec 2920C SCSI controller and JAZ drive: but this is another story.
(off topic: anyone an idea why e.g. XP explorer locks up when JAZ drive is switched on during boot?)

Second surprise:
After I found that the JAZ works in XPs "safe mode" (German: "Abgesicherter Modus") and since I am able to access it as drive F: in this mode, I found that the disks I formatted on my CT2 Falcon (Cecile, latest version) report a "RAW" file system under XP and, of course, I can't access the files on the disk.

Third surprise:
For a test I wrote a file from XP to a FAT formatted JAZ disk. The

Falcon reads this disk without problems. I copied two directories of audio files (~ 30MB each) to it (from the Falcon) and put it back into the PC again. Running checkdisk the disk still reports FAT file system but a bunch of disk errors in the second directory that I copied from the Falcon. The first one was ok, I could copy it's contents to drive C: of the PC.

Questions:
What's the RAW file system? Is what I intend to do a "no-go" for some reason? If yes, why? If yes, is there any other simple solution? Both systems are in separate rooms far away from each other. I have a SCSI CD burner for my Roland VS1680 that I could connect to the Falcon to burn CDs directly from the Falcon, but I have never tried it and I have no software yet.

Thanks,
Karsten

A solution that is known to work is using JAZ media that are both TOS and Windows compatible and have been created with HDDRUTIL/HDDRIVER (see http://www.seimet.de/hddriver_english.html). Your FAT partition does not seem to be compatible with both the Atari and Windows, and as a result data get corrupted when writing to the cartridge.
Without a special method of partitioning it is impossible to access

partitions bigger than 32 MBytes both from Windows and TOS because
Windows/DOS and TOS use different partition layouts.

If Windows cannot read the MBR/fat it can cause that. It is trying to

```
mount the volume on boot up and failing.

XP treats raw as partitioned but unformatted afaik.

Try formatting the disk on the PC.
What OS are you using on the Falcon? Both Magic and Mint can read fat
perfectly well. I use Zip drives in all my PC's for ferrying data to the
Falcon (Sneakernet;-).

See above. The only other issue to resolve (possibly), is cable length
and termination.

Mark

Thanks for your help. I guess the 32MB limit is the reason for the succesful copy of the first folder and the unsuccessful copy of the second one (both are around 30MB in size). So HDDRUTIL/HDDRIVER seems to be the way to go. I know that I have HDDRIVER lying round on my Falcon, though I must admit I'm not sure which version and if I bought it some time in the past or how it made the way on my HD ... anyway, I'm definitely not using it, since I use the Centek-recommended Cecile (2.18, if I remember right). I only work in CT2 turbo mode and the only application I use is CAF. Can I format the JAZ disks to the TOS/Windows compatible FAT when in turbo mode of the CT2? Is the demo of HDDRIVER ok to test if everyting works?

Regards,
Karsten

No, there must be another reason. The incompatibility of the partition layout affects the whole partition, not just everything beyond the first 32 MB. In a nutshell, the main difference is that the Atari always has 2 sectors per cluster and uses bigger logical sector sizes for partitions > 32 MB, whereas Windows/DOS always use 512 bytes per sector but more than 2 sectors per cluster instead. That's inherently incompatible.

> to be the way to go. I know that I have HDDRIVER lying round on my Falcon, though I must admit I'm not sure which version and if I bought it some time in the past or how it made the way on my HD ... anyway, I'm definitely not using it, since I use the Centek-recommended Cecile (2.18, if I remember right). Is the demo of HDDRIVER ok to test if everyting works?

I'm sorry, but the demo is limited in its functions and in particular cannot partition a drive.
As far as the full version is concerned there are no known issues with formatting in turbo mode (partitioning is actually enough, formatting is just a waste of time).

I use the VS-CDR II (Roland burner) on my Falcon. It's actually a
Plextor (QPS Que) drive and works great with Extendos software. It's
been the most reliable burner I've used.

The problem when using XP can't be caused by the JAZ disk - the one I used was a newly formatted FAT disk for PC with no contents. The system comes up "as normal". When I start the explorer the explorer locks up, when I start a cmd-session and try to change to drive F: the cmd-session locks up, when I try to call the driver properties from within the device manager, then the device manager locks up. The OS is still running and remains unafffected by these locks, though I can't shut it down properly since the locked-up processes can't get killed. When I press F8 during boot and select "safe mode with console" (I don't know how it's called in English exactly ["Abgesicherter Modus mit Eingabeaufforderung" in German]) I *can* change to drive F:, format JAZ disks, copy files and so on, no problem then.

I am afraid it is still commercial (do not know why since it is not supported
anymore). I would have your friend look into Mint. If it a great OS and is
still supported and upgraded.

I bought HDDriver to solve my compatibility problem between TOS and Windows JAZ disks/partitions (see thread below). The manual states that there are some more icons supplied in a file called ICONS.RSC that can be used for the tools that come with the driver. What do I have to do to make the icons show up in the icons dialog? I tried the following:

Copied ICONS.RSC to the root directory of my boot partition:
No changes.

Renamed DESKICON.RSC to DESKICON.RS_ and ICONS.RSC to DESKICON.RSC:
All icons that I used previously are gone then and are replaced obviously by the ones in ICONS.RSC (I expected this behaviour but tried it anyway).

I don't know how to merge two files together, otherwise I would have tried this last option.

The falcon manual gives no answer.

So, what's the solution to this problem?

You need a program to edit RSC file, and copy icons from one file
(ICONS.RSC) to another (DESKICON.RSC). Known pograms are RSM and
Interface, demos of them should be downloadable over the net.

Ever thought of using a RSC editor? First make a backup of both RSC files. Then load them into a RSC editor. Bring up the icons on both and copy (or drag) the icons of one onto the other. I have done that with great success.

Well, I heard from Adam that I need a software like that. To be honest:
I don't want to buy software only to add a few icons to my desktop. The
RSM demo is "save"-protected. Is there any freeware available? I don't
want to do much editing, simply add the icons of one file to the other.

Yes, this is the program that I use. Infact, version 2.33 is newer that the
one that I have now (2.3). I will have to get that. Thanks...

you won�t be able to do it as you intended :(
pc doesn�t read atari format and vice versa...only floppy disks are compaible, but hard disk formats are not...
it is possible with the use of hd driver and magic but i have never tried it...
burn copies and backups on your falcon with a simple cdr...it is much easier...

well, there is simple reason for it - I don't use hddriver :)
I only tested it on a friend's comp...;)
but I recommend it to those who seem to need it...

Boot into plain TOS. GEM uses blitter, if it works, blitter should be ok.

Thanks for your warning, but it's already done, running and ready. I
bought HDDriver and can use partitions up to 1GB one my (recording)

```
hard-disk and JAZ, it works with CAF and XP, perfect for me. Since I
re-installed WinXP on my PC I can even use the JAZ drive there without
crashes, but that's another story ;).

With HDDRIVER, you can partition the JAZ disk (as a single
partition only) that is both PC and Atari compatible.

You should use HDDriver. It is the best out there for the Atari line of computers. I will use it on a new 9 Gig hard drive to get it ready for an

instillation of Linux.

Which Linux distribution are you going to install? I have still an old
Debian Linux (2.0.36) kernel running on my TT, and when trying to
install Debian Sarge the installation failed because the VME network
card was not recognized. (This is not a hardware problem because the old
Debian installation works fine.)
On the other hand, it's probably better not running a current Linux on a
TT, because it needs even more memory than the old installation ;-).

I am talking about Debian Sarge. I have a Hades kernel (version 2.2.8) that was put together for me by Wout Klaren. It worked well when I installed the Debian Slink. Then I upgraded by Hades with some chips I received from Fredi and Linux did not work and I could not re-intall it for some reason. So now I am trying the Sarge version. The installer loads fine (with some font problems) and it does recognize all of my peripherals.

```

Well, I had an Adspeed accelerator and I wanted to use it in the Mega2 ST that runs DarkForce. I've never attempted anything like this before. I've done a little soldering on my Falcon, when I added a standard PC power supply, moved the LEDs up to the front of my Wizztronics rack case, stuff like that. I guess I should have known better. My "do it myself" attitude got me in trouble this time.

Anyways, you have to remove the existing 68000, and replace it. Ideally, I guess you should put a socket back in, but I didn't have one. I snipped the legs of the 68000, then removed them from the MB by heating the solder and pulling the snipped parts out. All of this went fine. I had a heckuva time trying to get the remainding solder out of those holes! Took forever, and well, TBH, I did damage. I must have got things too hot because a few traces lifted up from the MB. :-(

At this point, I've got the Adspeed soldered in, and I managed to reconnect the 3 traces that came up (they didn't break). I reassembled just enough to see what was going to happen. Power came on, floppy came on, I got a video signal. I've got the usual square in the center, but the colors are way off, and thats as far as it goes. So something is obviously not right.

I've got a multimeter so I've been trying to check each connection. Using the red end on the socket on top, and using the black end on the leg sticking through the MB on the bottom. I get a "pegged" reading when I do this. Is this right, if I don't get a reading at all, then its a dead connection? I did find 2 so far (the meter doesn't move at all), I'm going to try re-soldering them as soon as I get the time. Is there anything else/another way to check the work that I've done?

Or is it too late? Is this a lost cause? I thought about sending it out to have it repaired (if possible). I called Alex at ATY Computers (he's funny, I told him what happened and when I got to the part about the traces he said, "holy ****!"). He offered to take the job, but told me up front that it could be a time-consuming process and he charges $40 an hour. Thats pretty rich for this poor white boy. Especially considering you can get used Mega STs for not much more than a couple of hours of his work time. (nothing against Alex, he's gotta make a living after all).

Any thoughts, suggestions, or <lowering head in shame> criticisms are welcome.

Thanks everyone.

Hi Ronald

Make sure its not something simple like your monitor not needing degaussing first, switch it off for half an hour or more ,then power up again

Verily, it was written by Ronald J. Hall <dark_lord@charter.net>:
> I've got a multimeter so I've been trying to check each connection. Using
> the red end on the socket on top, and using the black end on the leg

> sticking through the MB on the bottom. I get a "pegged" reading when I do

>

It sounds like it could very likely be a 'cold solder joint'. What that means is the solder plus pin combination didn't get hot enough to melt the solder 'onto' the pin (pretty common with relatively-inexperienced solder-ers [as you claim to be. ;)]). Examine the soldering job: if there is any place where the solder looks like a small 'ball', it's probably a cold solder joint. In this case, your choice of re-soldering those connections should work. I'm rather surprised the machine came up at all if that's the case.

Good luck!!

Inexperienced at soldering? Heck, look it up in the dictionary and my picture is probably there. :-)

Alright, I'll try to apply all the points you've brought up.

Thanks for the reply.

> Good luck!!

Thanks. Methinks I'll need it.

Not sure if you have done this or not.

But when you desoldered the pins and solder out of the 68000 holes, did you have the whole board apart so that you could check the underside of the board?

If not, you need to check to make sure the stray solder didn't make a connection on a track or component on the bottom of the board.

When removing solder, you need to use something like a desoldering wick. Which is basically copper wire that is braided. It comes in small spools and you can get it at Radio Shack. There are other ways to remove solder but the wick method works well for small amounts.
What you do is place a piece of the copper wick over the solder to remove and heat the wick. Which draws the solder into the wick and away from the PCB board.

It is possible that you overheated the holes that the 68000 was in when removing the solder.
If so, it can run to the underside of the board and connect to things that will cause problems so look there for extra solder.

Or worse, it could have destroyed the contacts that the actually 68000 pins connect to.
These can be fixed, just make sure that the pins holes are connecting to a track.

Some may actually not be connected to anything, but most should be.

A good solder connection will be shiny when done right and a cold solder joint will be grey looking like a lead sinker if you happen to ever go fishing.

If you lifted the PCB tracks, these can be fixed with jumper wires if they are beyond normal repair with solder. Just take some small copper wires that are insulated. Trim the ends, and solder each end to a good part of the track. This should work unless there are a ton of tracks that have to be fixed.

Also when soldering in the 16mhz 68000, Solder it in from the bottom of the board if possible.
I believe this is the way they were put in from the Factory and will help keep you from spilling solder on the wrong pins.

And take your time when doing a job like this.

Use a Wet sponge or towel to remove excess solder from your soldering
Iron if you are using
a plug in type Iron. And if you have a good piece of Iron Metal, Put the
Iron on it when not using
it so that it doesn"t get to hot. The Metal will act as a heat sink
keeping your Iron in normal
operating range. Good Soldering Iron Tips are also key to a good job as
well.

If they are gobbed up with solder, heat them up some and take a unwanted
knife or etc and scrap that
off. Then put a thin layer of solder on the tip and let it cool, Before
using again.

Also, make sure you don't put the board or chips on carpet or anything
that can cause static
electricity. Use a good wooden desk or similar to work on.

Basic tips that may help ya in someway.

No reason why your computer shouldn't be brought back to life once
you've made sure of all your connections IMHO.

Well, honestly, right now...not too good.

I used a multimeter to check for continuity through the chips soldered connections from bottom to top (through the MB), and one entire side seems good, while the other side had about 4 pins that would not carry current through. I tried just a "touch" and reheating them, and this seemed to have worked for 2 of them. The other 2, are continuing to be quite stubborn. I tried adding just a bit more solder but no luck. I'll keep at it, but I'm concerned that I might be doing more damage, that I can't see, or maybe the traces/tracks on *top* of the MB, but under the chip itself might be damaged.

<sigh> I guess I should have known better, and left it to the hands of an expert.

Very possible, I did have problems getting the old solder/legs out.

Well, here is where I screwed up as well. I direct soldered the Adspeed
accelerator in. I should have used a socket instead. Now, I can't *see*
the connections from the top. :-(

> I have over 12 years of hand soldering at my old job. You name it I have

Hard-wire from the connections you can see to the nearest pads on the
same traces.

Or desolder your Adspeed and put a socket in (you want a turned-pin socket).

I'd probably go for the first option TBH!

Thanks Derryck. I've had to work all weekend (12 hour shifts) so I've not had another chance to look at it.

Gonna give it my full attention over my next couple of days.

Thanks again! :-)

Hi all,

I was just using my falcon when the keyboard stopped working.

It's something on the motherboard because I tested the keyboard on another falcon and it works fine. I tested the connector on the motherboard on the keyboard connector where 5v should be and it's not there. I could not see a fuse or anything near the keyboard connector to check or replace.

```
Any ideas?
Rory

Well an easy but improper way would be to solder a wire from another 5V source to it. If you probe the board in that area (+ end of big capacitors) you can find another source. You must have had a short or something adn there must be a fuse or something blown. Rodolphe would know best.

Thanks,
Mark

Hi Rory,

I think it may be the same issue as was discussed in this old thread:

http://groups-beta.google.com/group/comp.sys.atari.st/msg/a1ca52fb18919bec?fwc=1

I have had the same prob you are seeing, and managed to take 5v from another source. Not 100% sure it was the exact same pin as is described in the posting that the above URL is pointing to.

Regards,

/Joakim

Hi Rory,

If you take 5v from another source and it makes the keyboard work then it may be alright to use it like that.

However, If possible I would try to discover what caused the problem as another part of the Falcon may also be affected by this problem.

If you are not getting power at the pins were the keyboard connects to the motherboard.
It is possible that you have a broken solder joint under one or more of the connecting pins.

You could try carefully moving each pin and see if any seem loose. And if you want to do a more careful look. Take the case apart and look under the board were the pins are to see if you have a broken solder joint.

If all seems well then we need to find out where the tracks of these pins goes to next and look there for trouble.

If you have the case apart or have the proper Falcon diagrams, then we could track them back to the
next component and so on.

However I feel that its probably a broken track or bad solder joint, like what happens with the
Mouse and Joystick ports. The solder joints get worked loose from unplugging the mouse and
joysticks.

If you have done work on your Falcon before and have removed the keyboard a few times. It could
be the same thing.

If you have a soldering Iron and some solder, and the time. I would go over each joint and see if that
fixes the problem. If it doesn't, then thats one thing out of the way.

Generally thats how you fix problems like this, unless you know for sure whats causing it.

You eliminate what could be causing the problem and whats left is usually the problem that needs fixed.

If you do go for the 5v fix from another source. Just notice if you have any problems with any programs
when running the machine.

Hi all,

I ran 5v from another point and the keyboard lit up. However the keyboard is sending keystrokes to the motherboard, but they are not registering to the motherboard. The HD spinup bar will shrink to nothing despite pressing the keyboard. The keyboard is good as it works on another falcon. I think there might something a little more serious. Rodolphe any ideas or should I send the board? 68B50?

Thanks,
Rory

I know this is a dumb question, so forgive me for asking, but it is
plugged onto the keyboard header correctly, right?

Reason I ask is I made the same mistake myself when I was re-casing my
Falcon in a Wizztronics rack case.

It acted something like you describe.

The problem is that some of the programs only work when started from
dirve A:. The other problem is that some of them work only if a special
sturcture of the image exists (that is modelled in the MSA file). The
third kind of programs work only when started during the boot process.

You burnt with a short circuit the internal trace from the L83 filter to the keyboard connector pin#4...

Here is the schematics :

+5V ---> L83 ----> Keyboard connector.

Just check if you get +5V on L83. (the middle pin is gnd !)
If yes, connect a good wire or a queue of a resistor between pin of L83 and pin#4 of keyb. conn.
You need only 1cm !
That's all !

Warning : this trace burnt here because it cannot burnt anywhere else ! It burn where it is the most easy to burn !!!
This mean that : if the trace is replaced by this stronger way (resistor queue or big wire), and if you do again a short-circuit, it will burnt somewhere else and maybe not at a good place...!

I have here a board from an italian guy :
It burnt inside the PCB between +12V and gnd...and the copper was fusionned and liquiefied inside the internal layer and touch now the +5v layer and some bus trace !
The PCB is dead !!! No way to repair that !!
The falcon mb is dead and just used for parts...

Regards

I have a (used) Marconi RB2 trackball - BTW, what a great device! -
for my CT2 Falcon. For whatever reason the left and right button is
swapped. Is there any driver available that allows to swap the buttons
(back) again? If not: is it possible to swap them by simply exchanging
two of the pins on the 9-pin connector? The last thing I could do is
modify the connections from the buttons to the PCB inside the
trackball, I know how to do that, but if posiible I want to avoid this
modification.

Thanks,
Karsten

That's probably the easiest way. I'd suggest making up an adaptor lead with a 9 pin plug on one end and a socket on the other, connecting pin to matching pin, swapping over only the two button wires.

I hate to say this but Ben seems to have a copy. No idea what shipping to PL land would be, assuming you really are in PL land.

I took a copy of this book to our computer club a few months ago, no
doubt Mark has still got it.

If the OP is interested I'll be glad to put them together!

HI there

I'd have thought there'd be a driver /ancillary application setting to fix that. Boot using a floppy based driver and look for switches

I have HDDriver 8+ but that only protects the root and boot sectors and it won't even do that because it's saying that drive C is write protected. Can't find any other setting to fix the problem. I'm on an STe with TOS 2.06 and 4mb ram.

I think this can happen due to disk errors. It depends if the disk has the S.M.A.R.T stuff or not. Someone else might be able to confirm it. I know if Linux (I know, a bit higher level) detects errors it immediately remounts the filesystem read-only. What's to stop disk manufacturers from doing this low level on critical errors, in order to protect the integrity of the data.

Thanks,
Mark

Have you tried running Diamond Edge or some other good Hard Drive
utilitie program
that will look for corrupted files and fragmentation?

If not, try and see if how the Data on Drive C looks.
The drive may need De-Fragmented or errors corrected.

Also, not sure if this has anything to do with your problem. But the
Cartridge Port's
default letter is Drive C. And I would think it would be write
protected since its
the cartridge port.

Are you sure your Hard Drive C is booting up online?

I have never heard of drives that write protect themselves in case of an
error. That does not mean that such drives do not exist, but I would
expect to have heard of them.

Could be, its been awhile since I have messed with the cart port as
Drive C.

It is interesting that Atari put this into TOS.
They must have had some idea for using the cart port for more than what
has been developed for it.

Anyone know if the Falcon and TT also have a Drive C for the cartridge
port?

Hi!

I tried to order a female mini-Centronics connector for the ACSI/FDD port of my STBook.

The port has 28 pins, so there is no suitable connector available. But still it is possible to order a 50 pin connector and to saw through it to get the correct connector size.

So I tried to order this kind of connector, but have been told that I have to order in multitudes of 10 pieces. This costs multitudes of 50 Euro which I don't want to spend.

Therefor my question: Are there STBook users that like to use a hard- or floppy disc with their STBook? (Attention: for floppy discs one had to layout a pcb containing the floppy controller!)

If I find at least two people that were interested in this (3 * 3 connectors, plus one spare for first attempts in sawing) I'd say the price was OK.

Regards,

Alexander

You could boot a Linux live distribution (i.e. one that does not have to
be installed on your hard drive but runs from CD) and then copy
everything with this temporary Linux setup.

Slightly more information may be required. What chip is that? I have
manuals for a lot of Motorola chips, and may have one for it.  Presume
you are talking about an ST, but I am not sure. I am only about
100 miles from the nearest Motorola sales office library, and,
```

assuming they still exist, could get manuals for anything Motorola that way.

That is an unusual question. AFAIK, except for statistical variation in the order of picoseconds, they are all available at once. What problem did you run into?

It's an Atari custom chip. CO25912
I'd like a datasheet for it but i doubt there's one readily available :(

> That is an unusual question. AFAIK, except for statistical variation in

> did you run into?

I have a memory hack in progress and wanted to know which lines are offered
to the MAD lines with which strobe signal, in order to generate new MAD
lines.

I think i have this sorted now, but i'd still like a datasheet if anyone has
one? :)

Egon

IIRC the 02-02 suffix on the 1772 in fact meant that the chip was good for
a wider temperature range, which made it more likely to work overclocked.

14:15. Deus qui signis evidentibus suam portionem protegit.[197]

Volumus signum videre de coelo, tentantes eum.198 Luke 11:16.

Generatio prava signum quaerit; et non dabitur.199

Et ingemiscens ait: Quid generatio ista signum quaerit?200 (Mark 8:12.) They asked a sign with an evil intention.

Et non poterat facere.201 And yet he promises them the sign of Jonah, the great and wonderful miracle of his resurrection.

Nisi videritis, non creditis.202 He does not blame them for not believing unless there are miracles, but for not believing unless they are themselves spectators of them.

Antichrist in signis mendacibus,203 says Saint Paul, II Thess. 2.

Secundum operationem Satanae, in seductione iis qui pereunt eo quod charitatem veritatis non receperunt ut salvi fierent, ideo mittet illis Deus optationes erroris ut credant mendacio.204

As in the passage of Moses: Tentat enim vos Deus, utrum diligatis eum.205

Ecce praedixi vobis: vos ergo videte.206

843. Here is not the country of truth. She wanders unknown amongst men. God has covered her with a veil, which leaves her unrecognised by those who do not hear her voice. Room is opened for blasphemy, even against the truths that are at least very likely. If the truths of the Gospel are published, the contrary is published too, and the questions are obscured, so that the people cannot distinguish. And they ask, "What have you to make you believed rather than others? What sign do you give? You have only words, and so have we. If you had miracles, good and well." That doctrine ought to be supported by miracles is a truth, which they misuse in order to revile doctrine. And if miracles happen, it is said that miracles are not enough without doctrine; and this is another truth, which they misuse in order to revile miracles.

Jesus Christ cured the man born blind and performed a number of miracles on the Sabbath day. In t

A few weeks ago I had a prblem caused by the floppy power lead becoming
disconnected.

Oddly, this caused problems with Highwaire and Aicq but it is
fixed.

A few days ago I noticed that there is another problem that may be related.

The Milan can read and write to floppy but it cannot format the disc, it
reports that the drive cannot be locked. I even tried formatting from
a bash command line and got the same error.

I've checked the floppy connectors and everything looks ok. Has anyone
seen anything like this ?

Regards,

Peter

Okay, using:

"telnet 24.177.21.201"
"telnet 24.177.21.201 23"

results in telnet: Unable to connect to remote host: Connection refused

while this:

"telnet 24.177.21.201 9999"

works, allowing me into the config setup for the UDS10.

Can someone please list the possible reasons/settings that would allow me
to access port 9999 from my ip address but nothing else?

Thanks.

What happens if you boot single-TOS and use the desktop's format routine?

I had the same idea this morning.

Formatting from TOS works fine so it must be a Freemint related problem.

Thanks,

Peter

I never did work out why the disconnected floppy power lead caused problems
```

with internet clients.

Everything worked fine except Highwire and Aicq which both refused to connect to the net.

MyMail, Newsie, CAB, aFTP all worked perfectly. The only idea I did have was that the disconnected floppy interferes with the Milan/Mint boot process.

I can't be certain when the floppy format problem began but since reconnecting the drive it hasn't been able to format floppies and I also have a problem sending e-mails with attachments from MyMail and Newsie. Plain mails work ok.

I can't think of any reason for thinking that floppy formatting and mail attachment problems are related but that was true of the original problem.

Regards,

Peter

Sounds like the problem I have... I can't get Higwire or Aicq to connect either, and I've never had a floppy connected to my Milan. I'll try to hook on up one day and see if it makes a difference.

Hi.
My CT2 Falcon suddenly died. Here's the whole story (for those who don't know: CAF is Cubase Audio Falcon):

1. On Sunday I started CAF, loaded my song but was interrupted then and left the system idle (CAF started, song loaded but not playing). When I came back the system had crashed with a CT2 error. I'm not sure but I think it was bus error.
2. I restarted the system and did the same as before (CAF started, song loaded but not playing). I was interrupted once again and when I came back, the system had crashed again. This time there was a TOS message box saying "invalid handle" or "invalid file handle" (I don't know for sure).
3. I restarted again and this time nothing happend anymore, the system didn't boot.
4. I opened the Falcon on Wednesday to check if there's a lose cable or if I see some other damage but found nothing (the CT2 red LED is on and both fans were running). After putting the computer back in place, it still didn't work at first, but
after a few tries my Falcon suddenly worked like before! I did many

reboots
this evenings fooled around a little bit with freemint etc. and began
to think it was a kind of "stuck-reset-button-failure" I had ...
5. On Thursday morning I started the system once more without any
problem to try if CAF will run without crashing. A few
seconds after starting, the system crashed when I tried to load my
song in CAF. This time there was no message, only a few vertical on the
screen and the mouse didn't move anymore.
6. I tried to restart, but the system is not coming up anymore since
then.

Current situation:
When the Falcon is off, my LCD display says "no signal".
When I power-on the LCD display switches to a blue background. No
message or logo appears.
When I reset, the display says something like "unknown mode", but the
background stays black.
There's no access to my SCSI-drives.
I disconnected the SCSI-drives and tried a system disk - nope.

I know that it's no easy, but it would be a big help, if someone could
point me to some things/pins/signals whatever where I could start to
locate the failure. I have measuring equipment (oscilloscope) and I
have a few skills when it comes to electronics.

Do you have any idea what could cause this failure?

Regards,
Karsten

Du hast vermutlich ein Problem mit dem NVRAM oder dem Arbeitsspeicher.
Warscheinlicher ist aber NVRAM.

Wenn ein CT2 mit dem blauen Schirm beim booten stecken bleibt, l�d der
Rechner nichts aus dem CT2 NVRAM. Du kannst das nur resetten, neu
einstellen und erneut versuchen den Rechner zu starten.

Kommst du im CT2 Mode nicht heran, erst unter TOS booten und dort das
NVRAM neu beschreiben.

Der Speicherriegel des CT2 Ram sitzt im normalen Falcon relativ nahe am
Netzteil, das Teil zieht Dreck an. Es reicht manchmal den Riegel zu
ziehen und dessen Kontakte vorsichtig zu reinigen.

Gru�, Robert

Hallo Robert,
das sind ja Mal ein paar Anhaltspunkte, wesentlich mehr als meine
Anfrage an Rodolphe Czuba ergab:

***
No idea... Are you sure the IDE HDD is OK.? Maybe it is a software
problem ... You have to investigate more..
***

Dabei habe ich gar keine IDE HDD mehr ... ;)

Ich nehme an mit "unter TOS booten" meinst Du den normalen Modus per
Schalter aktivieren? Da geht aber auch nix ... ich werde auf jeden Fall
mal die Speicherriegel s=E4ubern evtl. war's das ja schon.

Ich habe mir auch das DOITF030-FAQ runtergeladen, vielleicht komme ich
dem Problem auch damit auf die Schliche.

Vielen Dank zun=E4chst.

Gru=DF,
Karsten

Hi NG

Just finished fiddling with the SCSI on my trusty old STacy 2. It has the ADspeed chip installed, which means that the Power board barely fits over the slightly higher CPU-socket. Is this a problem?

After fitting the STacy back together again, I noticed a loose component, which I suspect have fallen out from some place near the power inlet. The component looks looks like a small darkbrown resistor, but without legs. It has a completely cylindrical shape and is a couple of millimeters long. It also could be some sort of condensator.

I figure that this missing component is connected to the power failure. The STacy does not react at all when trying to power it up.

I cannot find any empty sockets or abandonned soldering islands on the up-side of the motherboard.

Can anybody give me a hint?

Thanks, Peter Feddersen, Denmark

It would be handy for this newsgroup archive if this thread was in
English I think - can you both repost please?

I don't know the Stacy insides, but could it be a fuse? If this
has been dislodged, you won't get any power! If it is one, it sho
uld be in a clip or possibly spot-soldered to a pair of pads, t
hough you say you can't find any empty soldering islands (could

it be connected on the other side ?).

Just found out that the "fallen component" is in fact situated on the
print side of the maxtor HD.

Sorry Derryck,
my Falcon was running after I followed Roberts hint and removed both
memory bars, cleaned the contacts with pure alcohol and put them back
in.

Regards,
Karsten

Isopropyl alcohol was mentioned, that's commonly used in contact
cleaner available from Maplin etc in the UK, or you can buy IPA in
Boots (that's Isopropyl Alcohol, not India Pale Ale!) ;-)

First I'd give the power board a second look. If it's not fitted firmly in
it's socket, you could end up with the symptoms your STacy is having.

Regards,
Martijn

Hi

I�ve got power!
The problem with the Power Board is that it does not fit completely,
since the ICD enhanced chip is slightly higher than the 68000, which,
in turn, means that the Power Board slides of one of the sockets.

I have to refit the component on the harddisk, since my only working
version of Emagic�s Logic 2.5 is located on this! (The original disks
are malfunctioning).

If i do not succeed in getting the HD up and running i would
appreciate if some kind fellow user would
zip up the original Logic v2.5 files and send them to
fedder@webhiker.dk

Thanks
Peter Feddersen

I have just installed the May 2005 release of Mint from the Xaaes website and this has improved the mail attachment problem.

It has now been able to send some mails with attachments. One did fail, not sure why.

The floppy problem remains and I can confirm that it doesn't happen with 1.15.12

I have never installed flop-raw.xdd, is it needed with these later versions of Freemint ?

Regards,

Peter

I have gicen up trying to find ram modules for my TT on ebay. I have a TT030/2 which needs more ram, both ST and TT. Does anybody have the pinouts for the ram expansion sockets on the TT mainboard? I am going to have a look at building my own.

Thanks

Mark

Is there a way to emulate the floppy dirve on the ST? Similar to the sio2pc on the 800xl. This way it wouldn't be necessary to write msa images to real floppy to load them on the ST. (If it is possible to boot from the second floppy drive)

The question raised a few times in some forums. No, there isnt anything like that for the ST. Of course that is possible to make/develop such interface. But hardware-wise, its not as simple as the SIO2PC cable. It cant be done just with a cable and a couple of small TTL chips.

No, you cannot normally boot from drive B. So this would require a minimum
hardware mod at those ST with internal drive.

I'm not sure what type of drive that you are wanting to emulate.
Can you describe what you are wanting to do in more detail.

I know of a few items that do similar things but not sure if they
are what you need.

However, There is a small program that allows you to boot from
Drive B on a ST/STE.

I have it here in my archives.

There are a lot of MSA images available on the Internet. If I want to
use them,   I have to write them back to floppies and load them on my
ST.
My idea was to write an application on the PC. This application could
read these images. The PC would be connected to the ST via the PC
serial port and the ST floppy port for example. This way the PC
simulates the second floppy drive of the ST (and read the disk images).

The ST drive interface is almost the same as the PC one. It is not a
serial interface, you can't use a serial port. And even if it were, it
would be too fast for a standard PC com port.

This will work for some disks only, it won't work for many others.

Hi All,

Anyone know of a utility that will allow me to read some old Atari ST diskettes?

I have loads of Single Sided and Double Sided disks, I vaguely remember that the ST format was different to that of a PC.

Will any 1.44MB FDD be able to read the disks?

Ta muchly for any assistance you can give.

JP

There are many utils out there - the majority being DOS-based but there
is a Windows one called wfdcopy.

DOS ones: Makedisk and Disk2FDI (ST reading works in the shareware
version)

However, if you're running WIndows XP then you will face a few problems
as it doesn't allow the same kind of low level access needed by these
tools.

That's why I ended up getting a Windows 98 machine - for reading in disks
and for Ghostlinking files to/from my MegaSTE that I couldn't re-create
under DOS/Windows.

>
> I have loads of Single Sided and Double Sided disks, I vaguely remember that
> the ST format was different to that of a PC.

The ST double sided format was not different from the PC. It was the same
format, but there are a few differences. First the media byte from the boot
sector was not present in the first byte of each FAT. And the PC checks for
the start of the DOS bootloader. I wrote the bytes EB 34 90 in the first 3
bytes of the bootsector and the PC was able to read my Atari disks.

You can get a tool, which converts a double sided ST disk in the way, that
a PC can read it from my homepage www.mbernstein.de (its german).
Go to the download section, then to atari and then get st2dos.

With some windows versions (nt4, w95?) i dont need my tool. This windows
versions can read ST disks. With XP i have seen some problems to access
DD disks.

With single sided disks i exprect problems to read them. I think, DOS and
Windows could not read them because DOS and Windows dd never use this format.
And DOS and Windows are to stupid to use the information about the disk from
the bootsector. This is also the reason why DOS and windows dont read other
than standard TOS disks (e.g. hyperformat).

> Will any 1.44MB FDD be able to read the disks?

Any 1.44MB Floppy can also read a 720KB disk.

I had the idea to write a MetaDOS driver. Then you can put these images
on a harddisk and mount them on your ST. I would prefer this solution
because it dont need any hardware. But you can�t boot from such a mounted
image.

I hope i will find some spare time this year to write such a tool. It should
not be a big work.

There is/was an accessory named DIMFILE; I picked it up from a web site named "The Croatian Atari Page" or something like that... It creates a sort of RAM disk into which several types of disk images can be loaded. IIRC it is supposed to be able to execute the boot sector of a disk image.

From the text accompanying the program:

```
>This accessory can load disc image file into memory and declair it as drive
>specified in name DIMFILE?.ACC. If drive already installed, taking over
>if DIM-file is loaded.If not loaded, drive works as before. If error occured

Ah, I see. Looks like I shall be heading back to my old Minix
partition and the corresponding kernel. I can't get the latest
kernel to recognise it. Perhaps it's just the new filesystem
driver, I'll have to tinker.

Cheers!

First, I would recommend using small schottky diodes instead of the 1N4148.
Second, AFAIR, the ROM2 signal is not open collector, so pulling that low
via a diode may overload the output driver in the MMU, or lead to unstable
operation due to unstable signal levels - I would really suggest ORing[1]
the F138 output with the original ROM2 signal and feeding the output of that
OR to the Eproms - like in the original text you linked to.

Yes it definetly worth a try, but first I've to buy one. ;) BTW, dont
you know a place where I can get one? There is one on ebay, but he
only ships to the USA. I'm from Hungary.

Hi Michael,

> First, I would recommend using small schottky diodes instead of the
> 1N4148.

For what reason?
The 1N4148 is darn fast anyhow, would the reduced voltage drop of a schottky
make any difference?

> Second, AFAIR, the ROM2 signal is not open collector, so pulling that low
> via a diode may overload the output driver in the MMU, or lead to unstable
> operation due to unstable signal levels - I would really suggest ORing[1]
> the F138 output with the original ROM2 signal and feeding the output of
> that
> OR to the Eproms - like in the original text you linked to.

ROM2_ isn't open collector :(
There's .06A between it and ground @ 5V.
I have tried grounding the ROM2_ line, to see if it did cause damage to the
MMU. After 20 odd minutes of it being grounded the MMU didn't seem to
dissipate any extra heat and doesn't seem to suffer from it.
(Any mega with U12 fitted has it's MMU ROM2_ buffered by it also)

I agree that adding the AND gate makes it a better circuit but i don't seem
to be able to find a single AND gate in IC form. Using the 74x08 is a waste
for one gate, DTL is an option I suppose.

TI used to offer some single gate ICs but i don't recall the part# :(
.
Thanks for the comments.

Egon

It is likely possible to install easymint to a minix partition. Simply set up the partition, then pick up with the Easymint install from there. Basically, it just sets up a directory tree and unpacks a tarball anyways.

That being said...

MiNT and MagiC both are pretty crippled without HDDriver...there's just so much it adds. In fact, most of the serious benifits worthy of upgrading to a multitasking OS of either system (MiNT/MagiC) rely on HDDriver. For starters...the code is XHDI compatable, and current development on device modules are really counting on that (I.E. ext2, riser, ext3, and so on). You also get the raw SCSI driver threads...for slews of 'other SCSI hardware'. Then there's the added support for removeables, DOS/GEM partitions, and the list goes on and on and on.

HDDriver is the one truly MUST HAVE piece of commercial code for a Falcon in my opinion. If you're running CuBase Audio, ask for version 7.93...otherwise go for version 8.
Great stuff!

Brian

Yes.

A 1N4148 has about 0.7V Vf at low currents. A Motorola 74LS00 has about 0.4V Vol, which makes a low level of about 1.1V.

The typical input threshold of a 74LS is given as 1.0V at 25�C in the Motorola databook - which means you can not reliably drive a TTL input low with a 1N4148 in series. Now depending on input threshold (CMOS has a higher threshold, so you have more margin), and variations on output characteristics, this may or may not work, but a BAT43 or similar will give you reliable operation in any case, so why gamble?

With 60mA Ioh, the MMU will at least pull the "L" level even higher, reducing margins for reliable operation.

They still have them - I recently used them in a design where I really only needed one gate.

A quick search at ti.com finds AHC1G08-5, SN74AHCT1G08, LVC1G08-5.0, but all single gate ICs I know are SMD only, and in low quantities, they are probably more difficult to get than a standard 74F08.

Diode logic has a slow RC turn off, so a low-value pullup resistor will be required.

cu

Hi Michael,

> but a BAT43 or similar will give

> you reliable operation in any case, so why gamble?
Yes, you're right, why gamble.
I've updated the schematic to have schottky diodes.

> Diode logic has a slow RC turn off, so a low-value pullup resistor will be
> required.

The 74F08 is in the new board here with TOS switching.
The webpage will be updated shortly with it.

Thanks for your comments and help.

Egon

There is no Ext3 or Reiserfs driver for FreeMiNT.

Looks like it can't be done then. Thanks for the information.

One point of clarification, though - isn't it the input device
(keyboard) that sends the commands to the computer (in this case, the
new MAC Mini), not the other way around?

Does anybody know whether it would be possible to connect an SM-124 monitor to an amiga computer?

What standard does this monitor need as input?

Maybe you can connect the A3000 scandoubled output as input to this monitor.
Or is it possible to connect normal Amiga RGB output to this monitor?

Any idea about the wiring conversion between computer and SM-124 monitor?

Send answer to your_energy NOSPAM ad hotmail dot com

Thanks

Pascal

>>Yes, of course! You might use a 3V lithium cell too, CR2032 or the strong
>>CR2450 (3V 500mA).

Note howevever that 4.5 V is a sort of quick and dirty solution if you
don't know if your TT uses 6 or 3.6 V to feed the battery.

Quoting Chips 'n Chips by Michael Ruge:

Achtung:

TT030 Platinen mit Daughterboard oder gesockelter PGA-Ausf�hrung der
68030 CPU brauchen eine 6 Volt Batterie, die TT030 Platinen die eine
gel�tete 68030 CPU links vom ST-RAM haben, brauchen eine 3,6 Volt
Batterie.

Can't agree with this, as my TT, which has a socketed CPU, used to have
a 3.6 V lithium battery, which I replaced with a CR2032 one - and it
works fine : not a single minute lost so far.

I am not at home, so I cannot just look and see, but I suspect that the chip used for timekeeping is made by Dallas, and is a DS1728?, which runs on 3 to 5 volts. If so, any battery in that range will work. The necessary part is getting a battery that will not leak when it dies.

The long square battery in mine can also be found in a Pee Cee shop, as a replacement for some of its/their clock batteries.

In any event, the time chip is not a custom chip, and has specs that can be found. What Atari chose to use, as cheap and convenient at the moment, is a different question than the question of what will work.

Jim

> One point of clarification, though - isn't it the input device
> (keyboard) that sends the commands to the computer (in this case, the
> new MAC Mini), not the other way around?

No, it's the computer that sends the commands (mainly configuration) and the keyboard that sends the data about pressed/released keys, mouse and joystick events.

I've just looked it up in a book, the keyboard is "ready to use" right after powerup, so the whole thing should not be that complicated.

If you have a serial <-> USB transceiver and a device driver that translates the keyboard's data into something the Mac Mini understands the whole thing should be done already ;-)

Regards,

Alexander

Minor correction on the chip used for Atari TT clock purposes. It is Motorola clock chip, MC146818AP. The data sheet for this out-of-production part, replaceable with a Dallas chip and some board hacking, shows timing diagrams at 3 volts, so a 3 volt battery will work.

A five volt battery would be the practical limit, to avoid back-biasing things, so anything from a 3.0 volt battery to a 4.99 volt battery would work for battery backup of the clock on an Atari TT.

The rest is mechanical, and the problem of dead battery leakage.

Jim

Dave HDDriver may cost some money, but it is well worth it. I would just go
ahead and buy it. You never know when you will need it again for something
else.

Ok, i have now inserted 3 ordinary 1,5V AA batteries (4,5V) and it works just fine. Thank you everyone.

I'm working on designing a circuit board for my STe based on my VGA (hires mode) monitor adaptor (http://www.notator.org/html/contributions.html#st_vga) where I want to have the following features:

- 13 pin DIN connector for Atari monitors
- 15 pin VGA monitor connector for PC type monitors
- Red-green-blue trimmer resistors for adjusting the colours on a PC monitor when in monochrome mode (i.e. lets you get a green/black screen like in the old days, or any other colour).
- stereo audio out (for Atari STe) -phono or 3.5mm stereo jack -haven't decided what to use yet.
- switch for selecting mono or colour modes
- RF output for TV (simple: just put a phono connector on the PCB, then extend a cable from the RF modulator output).

That all sounds fine, but I have a couple of issues I'd like to clarify:

mono/colour mode switch

For full flexibility I want to be able to use the computer in all graphic modes (low/medium/high). If using a hires monitor this is taken care of with the monitor itself. As far as I remember, "high" (monochrome) mode is selected by the computer when pin 4 ("mono detect" of the 13 pin DIN monitor connector) is connected to ground.
If this pin *isn't* connected to ground, the computer allows you to choose between low and medium resolutions. Is this correct?

If I have a VGA monitor connected to the computer I would have to:

a) hard-wire pin 4 to GND, but this would also mean that I could never set the computer in medium/low resolutions (for playing games etc.)

b) add a switch which connects pin 4 to GND (on/mono mode and off/colour mode) which would be ignored if an SM-124/SM-125/SM-144 was connected and set to mono mode anyway,
but would allow me to select between mono and colour modes when a PC monitor or TV is connected.

I would definitely go for (b), but.... how would this affect a VGA monitor not capable of those frequencies, or an Atari colour monitor connected to the 13 pin DIN connector, when the switch is set to "high" mode?

Also, I remember a while ago when discussing these matters that VGA monitors usually can't handle the "low/ledium" frequencies of the Atari ST -does this still apply, or is it easy to get hold of a VGA flatscreen monitor that can handle all ST frequencies?
Those are as follows:

```
High (mono) mode         :  35.70 KHz horizontal  71.2 Hz vertical
low/medium (colour) modes:  15.75 KHz horizontal  50 or 60 HZ vertical
```

Go for B and switch the syncs & RGB for mono/colour outputs via CD4066 quad bilateral or similar perhaps?

Nothing i've tried so far drops low enough for the ST low/med res outputs :(

Not sure what you mean. Unfortuntaly my electronics knowledge restricts
itself to the practical side of things.
Are you telling me that I could somehow automate this, so there's no
need for an actual physical switch?

Something else along those lines that I've thought about.....
Pins 10,11,12 and 15 are "sense" pins. I don't know if these are
standard on all monitors, but perhaps they are on newer monitors.
Could I somehow use this for detecting when a VGA monitor is connected,
thus setting the ST to "high" mode, just as with an Atari mono monitor?
And when disconnected, the computer is set to med/low mode.

> Nothing i've tried so far drops low enough for the ST low/med res outputs :(

Maybe I shouldn't bother making the VGA connector output high and
low/med resolutions, but instead concentrate on just hires mono.

All standard VGA monitors should handle the mono mode, right?
What happens if I plug one into the ST that isn't capable of those

frequencies? Will it become damaged?

A few years back I remember trying to get hold of an accelerator and memory upgrade beyond the 4 MB limit for my STe. I never got it, and have since forgotten the details. I believe it was made by TUS (The upgrade shop) in the UK at the time.

Since I'm rack-mounting an STe it would be nice with a switchable accelerator as well as additional memory. I assume that the additional memory could be used for things such as the "Thing" desktop and "MagiC" which I both use, and leave a full 4 Mbytes of RAM for other things?

Anyone have anything like this for sale, or know where to get hold of it?

If you use something like the CD4066 IC to switch the signals for the colour monitor, and off when mono is enabled, it should stop any damage to the colour monitor caused by the high mono syncs etc.

I suppose you could automate the process by using one of the VGA ID pins to ground the mono select pin?
(Pin 12 i think was used for mono monitors)

There are two sets of "sense" pins on VGA.

ID0, 1, 2 are the old monitor detection pins, and use of them is supposedly being phased out.
Thee are something like 3 or 4 pins that send DDC data to the graphics card for ID.

>> Nothing i've tried so far drops low enough for the ST low/med res outputs

Switchable output is always bice :)

As far as i can recall, VGA 640x480 syncs are so close to the atari mono syncs as not to worry.
Any monitor that thinks those rates are too high is old, but will probably output a nice colour picture :)

Hi folks,

Does anyone have information as to which order address lines are placed on MAD0-MAD9 during a RAS and a CAS strobe?

TIA

Egon

Do you have any actual circuit schematic ideas with this in mind?
We can get back to that later once we've cleared up the other stuff.

> ID0, 1, 2 are the old monitor detection pins, and use of them is supposedly
> being phased out.
> Thee are something like 3 or 4 pins that send DDC data to the graphics card
> for ID.

This is all pretty confusing.
I looked up a site which gives the pinouts of different monitor
standards (http://www.monitorworld.com/Cables/video_standards.html) and
there are several "VGA" standards to be found, with slightly different
pinouts. Of monitors that use the same 15 pin plug there are these
standards:

(IBM) XGA/XGA-2/Super VGA,640x480 to 1600x1200,31.5 - 117kHz,40 - 110Hz
VGA 640x480 31.5kHz,60/70Hz
VESA VGA (DDC),640x480 to 1600x1200,31.5-106kHz, 56-85Hz
VESA Super VGA

The pinouts shared for all of them are:

Pin 1 - Red
Pin 2 - Green
Pin 3 - Blue
Pin 4 - ID bit
(missing pin 5)
Pin 6 - Red Return
Pin 7 - Green Return
Pin 8 - Blue Return
Pin 9 - No Pin
Pin 10 - Ground
Pin 11 - ID Bit
Pin 12 - ID Bit
Pin 13 - Horizontal Sync
Pin 14 - Vertical Sync
(missing pin 15)

So, among the 4 "VGA" standards, only pins 5 and 15 are different according to the mentioned website.

Does this mean that given the correct horizontal and vertical capabilities, that any monitor within the 4 connection standards above would work with the ST?

And could I somehow create a circuit on the ST that automatically detects that a VGA monitor of some sort is connected, setting the ST to "mono" mode, AND preventing the monitor from blowing up if the frequecies aren't capable of the ST "high" standard (35.70 KHz horizontal/71.2 Hz vertical)?

I don't quite understand the use of the CD-4066 chip. What will it actually do?

>>> Nothing i've tried so far drops low enough for the ST low/med res outputs
>>> :(
>>
>> Maybe I shouldn't bother making the VGA connector output high and low/med
>> resolutions, but instead concentrate on just hires mono.
> Switchable output is always bice :)

Yes, but simpler is also better ;-)
My idea is as follows:

- "mono" mode on the STe is selected when:
(a) an Atari mono monitor (SM-124/125/144 etc.) is connected to the original 13 pin DIN connector
or...
(b) a standard PC colour (or black/white?) VGA/SVGA monitor is connected to the 15 pin connector that I'm adding to the STe.

-"Colour" (med/low) mode on the STe is selected when:
(a) no Atari mono monitor is connected to the 13 pin DIN connector
or....
(b) no PC VGA/SVGA monitor is connected to the new 15 pin DIN connector
or....
(c) no monitor at all is connected to the STe.

And as long as (a) and/or (b) are met:
(c) an Atari colour monitor is connected to the 13 pin DIN connector
or...
(d) a TV is connected to the "TV out" connector

In other words: I would like the PC monitor to act just like an Atari mono monitor would do, meaning that it would set the STe to "mono" mode.

>> All standard VGA monitors should handle the mono mode, right?
>> What happens if I plug one into the ST that isn't capable of those

>> frequencies? Will it become damaged?
>
> As far as i can recall, VGA 640x480 syncs are so close to the atari mono
> syncs as not to worry.
> Any monitor that thinks those rates are too high is old, but will probably
> output a nice colour picture :)

Hmmmm.... but then again I would have to redesign the 15 pin output
circuitry for the STe to allow for colour modes on that connector.
That sounds complicated -do you have any good ideas?

Nothing specific, Only ideas i thought whilst reading the posts.

> So, among the 4 "VGA" standards, only pins 5 and 15 are different
> according to the mentioned website.
>
> Does this mean that given the correct horizontal and vertical
> capabilities, that any monitor within the 4 connection standards above
> would work with the ST?

I would've thought that any monitor that has the correct sync inputs and the video drive on the correct pins would work without any problem.

> And could I somehow create a circuit on the ST that automatically detects
> that a VGA monitor of some sort is connected, setting the ST to "mono"

I would like to think so, though how complex the circuit might get to cater for all the standards would need looking into.

> I don't quite understand the use of the CD-4066 chip. What will it
> actually do?

It's basically 4 switches in an IC package.
When i mentioned it i figured you could use it to enable the syncs when in colour mode and isolate the syncs from the colour monitor when in mono mode.

There maybe better solutions but that IC sprung to mind when i read your post.

> Hmmmm.... but then again I would have to redesign the 15 pin output
> circuitry for the STe to allow for colour modes on that connector.
> That sounds complicated -do you have any good ideas?

I'll do some scribbling and see what I come up with, drop me an email and i'll forward any ideas to you.

Egon

ST High is very close to VGA. The main difference is 1.0V PTP instead
of 0.7V PTP. However, the higher voltage generally just means a bit
more brightness. You could add resistors if you wanted to get 0.7V.

ST Low/Medium are far below what any standard computer monitor can
display. However, a line doubler (like the Viewsonic N4) can allow
those signals to be displayed on a VGA monitor with only a little loss
of clarity.

Thus I would recommend the following:

Run a physical switch to pin 4. (You can't have low/med/high all
available at once).

If ST High, just run the pins out to VGA (perhaps with resistors).

If ST Low, run the signal through a line doubler.

Galen

No problem. I've added 47 Ohm resistors to each of the following 3 lines: Red, Green and Blue.
Alternatively, 100 Ohm fine-trimmers can be used, which is great if you want your screen to not only be standard black/white, but green/black, orange/black, blue/black or whatever you like!

Maybe those aren't the ideal resistor values, but it works -any opinions on that?

> ST Low/Medium are far below what any standard computer monitor can

Never heard of line-doublers...
Did a little search and found the model you mention here.
Seems like it's a box made for "turning a computer monitor into a TV and multimedia centre"

So from what you're saying; this box turns the rather low frequency range output of the ST (in colour mode) into more suitable frequencies that a standard PC monitor can handle? Just like it would turn a TV-tuner's output into a more suited frequency range for the monitor?

A little expensive solution at around US$ 100 though.
I don't think it's worth it for me, because the computer will mainly be used in hires mono mode anyway, but if it was just a matter of adding some cheap components to the circuit I would like to have the ability to use all 3 modes.

Pin 4 of the VGA connector that is, right? Being marked as "Sense 2 -ID bit 2"
Not the 13 pin DIN connector on the Atari ST, as pin 4 there is "mono detect".

Hmmmm.... sounds like a plan, except the line-doubler is pretty expensive in my opinion, and also very big. I'm trying to put the whole computer including hard-drive, CD-ROM and lots of MIDI extras in one single 19" rack enclosure.

Hi, Hallvard!

HT> Pin 4 of the VGA connector that is, right? Being marked as "Sense 2 -ID
HT> bit 2"
HT> Not the 13 pin DIN connector on the Atari ST, as pin 4 there is "mono
HT> detect".

I guess Galen thought of the latter: With a multi contact switch you could select ST High or Med & Low resolution. The contacts then need to be wired inside your monitor switch box in such a way that (a) the mono detect is grounded or not and that (b) the appropriate signals from the ST are propagated to the VGA/ST Monitor/TV connector(s).

Instead of using a multi contact switch you also could use a simple switch that is used to control some kind of IC switches (like Egon suggested).

Regards,

Alexander

yup, there was pak 68030 accelerator but I guess it is impossible to find nowadays on ebay since
it was working very well and all users were reluctant to sell it ;)
more likely that you would find a whole comp with it...

well, I did this with scsitool and hdddriver and you should also be able to do it with some hex editor, too...
hddriver may be bought while scsitool is not commercial any longer...

there should be small utility named centvidel...its use is really selfexplanatory
once you start it...
you make (extend) resolution and then save it to video.dat file...

You're probably right, and I'm trying to get rid of some of my gear. I'm tired of having a "computer museum" if you know what I mean ;-)
A nice, compact, upgraded STe in a 19" rack is what my goal is. Too bad I couldn't get my Mega STe to fit in a 19" rack enclosure -the mainboard is too wide.

What about that accelerator/memory upgrade board from TUS in the UK? Anyone have one around they don't need? Or did that one work equally well as the PAK? ;-)

It will fit in a 19" rack............

> What about that accelerator/memory upgrade board from TUS in the UK?

You refer to the Veloce+.

You should note it will not run Notator SL.

I just finished looking at a 540ST, in order to do a little hardware project involving the YM2149 sound chip. Information on the chip was easy to find on the web; I managed to obtain a schematic for the ST, and the Yamaha datasheet for the 2149. After examining the write cycle timing with the ST in, I guess it could be called "keyboard not found error" mode (continuous tones emitted), it seems that the access and hold times are significantly shorter than those printed in the datasheet (measured: access time 180ns, hold time 50ns) Does anyone know if the chip actually used in the ST, with the "F" suffix, is supposed to mean something like "Fast"? The datasheet doesn't mention any suffix designations. Did I make a mistake with my measurements somewhere? I saw some references with google that seemed to imply that there were both chips with no suffix, and and F suffix, (and a C suffix?) but there was nothing I could see that stated what the differences are.

I've just bought an MC68882FN25 FPU. I put it in, but it is not recognized (for example by Kronos). I read several newsgroups (old ones from 1991-1995) about MC68882 and MegaSTE mentioning that some kind of PAL (GAL?) chip is required. Is it true? Where to put this chip? If yes, then can anybody help me to get one?

Thanks,
Jozsi

Your only chance is to ask best electronics for MegaSTE FPU Kit.

Its not simple, you also need a GAL chip that's absent from the mother board in order to use an FPU. AFAIK it performs address decoding and the starting address of a memory-mapped MC68881 FPU is computer specific. On an Atari it is $FFFA40 but on some other machine it may be completely different.

You may found someone to burn a compatible GAL chip for you.

Regards, Robert

This is a topic of little interest, except to me. I have a ZIP drive on a scsi bus, attached to a TT030, and it keeps causing bus errors.

The two little switches were fine, but the actuators did not stay put.

Those things come apart with a screwdriver twisted in the slots in the side.

I did some measurements, and decided that a solder blob jumper across the three pins of each of the two switches would give me a permanent "jumper on" and a permanent "scsi 5". If you need the opposite, jumper two of them, after seeing which two are connected with the switch push button not pushed by anything, and lift the other one.

Now my ZIP drive is not causing bus errors, and mysterious problems. And, that frees up an active terminator for other uses.

I just got an Atari 2600 off of ebay. Before I plugged it inj I noticed a rattleing noise so I opened up the system. The A/B switch is broken, and the whole inside looks like it needs a real good cleaning. Where do I start?This is a Rev. B board. My other hobby is restoring arcade games so I'm not a total noob to board repair and diag. Just need good info on the 2600 home system.

Thanks!

The HD can be internal, just the interface is left outside. The main
advantage of this product is that it is really plug and play. No
soldering at all, just plug the interface into the rom port, turn the
power on and you have IDE.
I can't say too much about compatibility, since I don't use MagiX. (I
have to say that on my MegaST I only use TOS and I've been using this
interface for one month and just wanted to share my experience.)I don't
have too many expectations from the 4MB of ram and the 8 MHZ processor
to run those kind of things.
I grabbed and old 1GB HDD out from and old 486PC and it worked.

I believe I have one of these boards, 'TOS 2.06 and IDE' but only a German manual.

Any one got an English version, or fancy translating mine.......

I once had a Mega ST with an internal SCSI drive using the ICD Micro interface.

It ran very hot.....

For most more-less serious work on the Mega, you would have to use its 'High resolution' video mode (640x400 monochrome). This looks very nice on Atari's SM-124 monochrome monitor (one of the sharpest displays of those days), and also looks good on a monochrome (S)VGA monitor. Connecting a VGA monitor to a Mega in High-resolution mode is just a matter of appropriate connector, sync rates and signal levels being similar enough (72Hz vertical, 35.7kHz horizontal syncs).

Generally, a monochrome (S)VGA monitor will give you a much better picture than a colour one, because there will not be any moire effects when desktop patterns interact with the shadowmask dot pitch.

Maybe a very useful setup might be a -multisync- monochrome (S)VGA monitor able to sync down to 50Hz vertical, 15kHz horizontal;

such a monitor can be used with all three Mega's video modes.

Btw. as you seem to be a hardware-hack type, there is a very simple (two TTL chips) modification of the video circuitry which can give you (with a good SVGA montor) a monochrome high-resolution display of up to something like 750x480. Look for 'Lacescan' on the net.

> Well, now i just have to understando better how the TOS/GEM works. I read something about the desktop replacements, as the NVDI and others, but i'm not sure if they will work on top of the standard TOS ?

In fact NVDI is not a 'desktop replacement' but a replacement of another part of the operating system - of the 'VDI' ('virtual device interface'- a part of GEM). But anyway, all of these replacements (NVDI, desktops, etc) -are- designed to work on top of the standard TOS.

> I would like to run MiNT, but seems that will be very difficult to find an 030 CPU accelerator for my machine these days, right ?

Running Mint on that Mega would be possible even without an accelerator, but very impractical- horribly slow and would leave you with less than 1MB of memory. There are other multitasking options which are probably better suited to a 'small' machine like a Mega (e.g. Magic or Geneva).

> And just to take advantage of this message, do someone know how different the ASCI and SCSI standards are ? Isn't possible to DIY some kind of cheap adapter to just plug an SCSI-I HardDrive in the internal ASCI header ?

It would probably be easier (and cheaper afterwards in use) to devise a TOS 2.06 + IDE interface circuit. There are schematics for both components (i.e. TOS 2.06 and IDE) on the net, and you would have to combine them. I estimate its complexity to about 5-6 TTL chips...

> I miss a little a more abundant amount of DIY hacks information for the Atari ST. I'm an Amiga user as well, and there is a lot of info of this kind for that machine. And i'm a hardware kind of guy. Just love to tickle with the hardware of my machines. To say the truth, i have better times modifying my machines, than actually using them

There used to be a web site devoted to hardware hacks for the Ataris- the Vezz's hardware hacks page (don't remember the exact name), but I think it is not alive anymore :(-maybe someone will correct me?

Anyway, some of the hacks that you can do yourself on this machine may be:

- adaptor for HD floppy drives (very simple)

- MC68881 FPU (in fact simple, but a lot of connections)
- extended resolution (Overscan; simple)
- CPU overclock to 16MHz (relatively simple but in fact only about 10% gain)
- Complete system overclock from 8MHz to 10 or 12MHz (complex, but can have a bonus of giving you increased video resolution)
- IDE hard disk interface (moderately complex)
- TOS 2.06 EPROMs adaptation (relatively simple)
- Up to 14MB Alt-RAM expansion (rather complex).

Instructions for most, or all, of these can be found on the net.

Beware of the overheating problem if you put a lot of stuff into Mega's box!

Regards;

Hi Djorde,

Thank you for your reply.

>monitor able to sync down to 50Hz vertical, 15kHz horizontal;
>such a monitor can be used with all three Mega's video modes.

>Btw. as you seem to be a hardware-hack type, there is a very simple
>(two TTL chips) modification of the video circuitry which can give
you
>(with a good SVGA montor) a monochrome high-resolution display of
>up to something like 750x480. Look for 'Lacescan' on the net.

I've already downloaded this file, and all the hardware hack related files that i could find :)

But to say the truth, i don't think that i'll use the high resolution. At last by now. I want to know the machine a little more. And i'm a little compulsive in the hardware side. I just want to have the better i can get, even more if i can do it myself. This is the coolest part for me. And for the "better i can get" i mean to improve the machine that i have, as long i can afford it. I would love to have a Falcon. But it's very difficult to find one for sale, and they usually are very expensive. This is a hobby to me. I don't want to blow my money in old hardware. Although in the end i expend more money in old than new hardware :)

>In fact NVDI is not a 'desktop replacement' but a replacement of
>another part of the operating system - of the 'VDI' ('virtual device
>interface'- a part of GEM). But anyway, all of these replacements
>(NVDI, desktops, etc) -are- designed to work on top of the standard
TOS.

Very good to know that !

You know, my Amiga was, and still is my great passion. But after all these years, it's like there's nothing new, nothing that i don't know (almost nothing) about it. It's not as fun as it used to be.

Discover a new system and all the improvements of these upgrades, tickle with it's hardware that's the real fun ! Even more because the Atari ST is very close to the Amiga in some aspects. But even being close, they are different enough to make excited again :)

>>Running Mint on that Mega would be possible even without an
accelerator,
>but very impractical- horribly slow and would leave you with less
than 1MB
>of memory. There are other multitasking options which are probably
better
>suited to a 'small' machine like a Mega (e.g. Magic or Geneva).

I thought that Mint was 32 bit only. I know what you mean. And there's no point in trying such a thing.

You gave Magic and Geneva as examples. Is there more options ?

I read about Magic (the english docs i could found. Because i can't understand German). And it seems pretty cool. But it's commercial, and a bit expensive. If i would use the Atari as a daily work machine i think that Magic could be worth. Is the Geneva Free, or less expensive ? Is there some option in these conditions ?

I don't know where in the internet search for these things. I tried lots of searchs at google, but maybe i'm using the wrong keywords.

Isn't there a website that have some reviews, or a database of these replacements, and improvements for the TOS/GEM ?

>It would probably be easier (and cheaper afterwards in use) to devise
>a TOS 2.06 + IDE interface circuit. There are schematics for both
>components (i.e. TOS 2.06 and IDE) on the net, and you would have to
>combine them. I estimate its complexity to about 5-6 TTL chips...

I could find an IDE interface schematic. But it uses PAL chips. I can't program them. I would like to find others, but it seems that there are no other options. I thought about contacting Mario (can't remember the surname), about his commercial IDE+TOS2.06 upgrade board, but i'm not sure if it's still available, or if it's expensive. But this board seems to be really great hardware, with lots of features.

>There used to be a web site devoted to hardware hacks for the Ataris-
>the Vezz's hardware hacks page (don't remember the exact name), but I
>think it is not alive anymore :(-maybe someone will correct me?

I know that site ! It's still active ! There's maybe one week since i downloaded everything from there :P

It's a very good resource, but most of the projects have some technical issue for me. Most of the issues are GAL/PAL programming. Besides that there's no problem. I can make (simple, as i lack equipment) my own PCBs, soldering is not a problem, and i can even adapt or modify something that suits best my needs.

>Anyway, some of the hacks that you can do yourself on this machine
may be:
>
>- adaptor for HD floppy drives (very simple)
>- MC68881 FPU (in fact simple, but a lot of connections)

>
>Instructions for most, or all, of these can be found on the net.

I'm looking everywhere in the internet for about one month for ahrdware stuff, as well TOS/GEM information.

Most of the stuff you listed here i found, and already have the projects/schematics. Except for that 14MB ram expansion, and complete system overclock (that would be interesting). And i'm willing to make most of them.

But right now, my priority is a hard disk interface. And one that is cheap enough. Right now, the only option i have, is to buy an MegaFile 40, or similar from eBay. But they are ridicullous expensive. I can't agree to pay more for one of these, than my 160GB harddrive costed me ! And i live in Brazil, so the shipping costs would be yet more expensive than the HD itself.

I discovered two days ago an program that do for the ST the same that APE do for the PCs. I whant to hang my Atari 800XL with the ST. But i can't do it with floppies. Well, i can. But i don't want to !

And to generate games disks, demos disks, i think that would be really easier to do this stuff with a harddrive.

>Beware of the overheating problem if you put a lot of stuff into Mega's box!

Thank you for the tip, and all the info in your message.

Best Regards,
Marcelo Pires.

     Hi, Barrie!

BaK> > > Q: Can I use a regular PC serial mouse on my Atari ?
BaK>
BaK> Short answer, no. Longer answer, needs more hardware.

Sorry, but you're wrong: You can plug in a serial mouse to the serial
(modem) port. Depending on your Atari (1040/Mega or whatever) you might
need a serial port-adaptor (9 (mouse) to 25 (ST) pin sub d).

Place one of the existing serial mouse drivers in your AUTO folder and
there you go...

     Regards,

          Alexander

Hi, Michael!

MK> Does anyone know whether the ST/MEGA keyboard & mouse can be adapted
MK> for USB?

As far as I remember there are only converters for PS/2 keyboards to Atari. The point is that Atari and PC keyboards - although both using some kind of serial data link - require different command sets.

Regards,

Alexander

No I ain't!

You can plug in a serial mouse to the serial
> (modem) port. Depending on your Atari (1040/Mega or whatever) you might
> need a serial port-adaptor (9 (mouse) to 25 (ST) pin sub d).

Therefore extra hardware, I believe. I have never seen a serial mouse with a
25 pin plug.

If they do exist then.......
>
> Place one of the existing serial mouse drivers in your AUTO folder and
> there you go...

Except you can't then use a midi-modem adaptor when running Cubase etc.

I think it would have been schematic entry, it was popular back then.
Also, the ST prototypes were built with ordinary TTL logic IIRC.
Probably only a coupel of these in existance.

Thanks. What I meant was -- since my recollection is that the ST was
designed with PC compatibility in mind, whatever adaptors allow PC
peripheral devices to be made USB-compatible might also work with the
ST's keyboard and mouse. Not so?

Yes it is possible if you either have a compatible adapter or else have some
smart Atari tech rewire it for you. I actually have both.

     Hi, Barrie!

BaK> Therefore extra hardware, I believe.

OK, if you count plug adaptors as hardware - to me that's pure "wiring"
;-)

BaK> I have never seen a serial mouse with a 25 pin plug.

Me neither. (But I've seen Ataris with 9 pin ports for serial interface:
Falcon, TT, MSTe, STBook.)

BaK> Except you can't then use a midi-modem adaptor when running Cubase
BaK> etc.

Of course. Any occupied port is not free for alternative use.

Regards,

Alexander

You mean rewiring inside the mouse itself to change it from serial to
Atari-digital? That's a good idea ;-)

Regards,

Alexander

> Thanks. What I meant was -- since my recollection is that the ST was
> designed with PC compatibility in mind, whatever adaptors allow PC
> peripheral devices to be made USB-compatible might also work with the
> ST's keyboard and mouse. Not so?

PC compatibility in mind - that mainly refers to compatible ports (parallel, serial) and file system (floppy/hard disc with FAT12/16).

Making a PC peripheral device USB compatible - this usually is done by exchanging the hardware layer of the connection PC <-> peripheral from serial, PS/2 or parallel to USB. That is easily done with Atari peripherals as well. But this won't affect the protocol that defines the commands and data format that are exchanged between computer and peripheral.

So: Yes, you could plug a serial <-> USB converter to your Atari keyboard, but still the PC (or Mac) won't send commands to your keyboard that it could answer with appropriate data.

Regards,

Alexander

Hi Folks,

Does anyone know the IO address used by the various internal ethernet adapters?

I'm playing around with a "cheap and cheerful" internal adapter idea but am unsure as to a suitable IO address for it :/

TIA

Egon

Hi..

1- How does a 8051-Based Microcontroller operates when it receives an
analog Data on port P6.

2-If the MC have a latch connected to Port P0 and a Gal to port P2,
what it should do to comunnicate with it.

Steve Sweet <steve.sweet@no-spam.btopenworld.com> writes:

: Why its...

Oh, the nutcase, useful nutcase, but nutcase is back. There is no nine-pin connector on the ST on my repair bench/kitchen table. My TT does have nine pin serial connectors, and several of them. It is really strange to have two meece on one machine, and it gets everything and everybody badly confused.

As an aside, my TT has a 9-pin to 25 pin adapter to connect it to a modem. I have never seen a modem with a 9-pin connector.

So Barry is right, and you are wrong. If anyone needs a serial port mouse driver, I know I have one, because I have used one, just ask.

Also, I cannot be insulted. Just tru;

Jim DeClercq, patent attorney, psychologist, engineer, old guy. If you want to bother me at work, declercq@gdls.com. That is General Dynamics Land Systems. We make very good tanks and military vehicles.

Phone there, without country code, is 586-825-5585.

That's why your business is gagging for breath and you have to troll
newsgroups to sell Spanish key caps and your other returned as faulty stock
that you've still yet to give refunds for.

There have been 25 and 9 pin mice made by several manufacturers over the years. Genius used to make a 25 pin one IIRC. Also there are 9 pin to 25

pin female to male converters and vice versa. So any serial mouse can be
used on any ST/STe/TT/Mega or Falcon.

Mark

Okay, I've got Centscreen installed on my CT60 Falcon and I've not quite
got it figured out.

I've got CNTSCRN3.prg in the AUTO folder, after NVDI, but before
MINT. I've got the ACC in C, as well as the .RSC files and VIDEOMOD.DAT.

I just can't seem to figure out how to actually generate anything new with
it though.

Its reporting my current 640x480x256 color setup, but with the CT60 and
the MB mod, I was really shooting for 800x600 (or some odd size thereof).

I googled, can't seem to find a FAQ or a HOWTO, and the docs...well. :-)

Anyone have a link, FAQ, HOWTO, etc? Thanks much.

Hello.

The battery in my TT went dead some time ago, and i opened it today and found a 4,5V square battery unit. Now i wonder if i can use 3 ordinary 1,5V AA batteries instead? Please help.

> batteries
> instead? Please help.

You could use these batteries but they are prone to leaking after a short time, 3 button cells in series would be a better choice.

I never got CentScreen to work on my CT2'd Falcon, I had very odd screen
effects with half the screen wrapped around the back of the monitor and
so on.

I never had a moment's worry with Videlity, so that's my recommendation.

Hello,

Yes, of course! You might use a 3V lithium cell too, CR2032 or the strong
CR2450 (3V 500mA).

I had the exact same concern at my first centscreen installation, then after
reading (or better, understanding) the small readme file, I figured out that
Centscren basically installs a new video select dialog box replacing the
standard "STsmall, STmedium, SThigh" thing.
But you also have to create new video modes with the other application,
exspacially if you just have an "almost empty" videomod.dat set.

I currently use 800x600x256@80Hz
but sometimes I go for 640x400 TC

That sounds more like a sync issue with the monitor, did you get to try a
different telly with it?

That was my thought also, but it worked perfectly with Videlity  (and with
Screenblaster before that. Also had loads of pixel rubbish at the bottom of the
screen, so it seemed that it wasn't looking at screen memory properly.

> different telly with it?

Never got that excited about it TBH, if it wouldn't work with an iiyama!

Hi folks,

Can anyone point me to schematics for an memory upgrade board that will add ram above the 4mb boundary in an ST?

ST or Mega will suffice. Even unfinished work would be a start.
Just looking for ideas on how to go about it at the moment.

TIA

Egon

Well my friend actually took off the serial connector and wired it to an the ST mouse connector. The brand of the mouse he used was a Dexa. Works great on my STe. The serial mouse adapter from Mario Becroft allows me to hook up a Logitech mouse to my Hades. That also works great.

I remember reading a lomg time ago that someone had actually installed 8 meg
of ram in a ST. Not sure if that was true or not, but I would look in some
various ftp sites for that. If I run across it, I will post it here.

It's quite true.

I had a Magnum board with about that size of memory installed in an ST -
IIRC you plugged it into the 68000 socket and you also needed TOS2.06
(which went onto the Magnum board). So, plenty of soldering.

It was a commercial job of course.

Probably. The "33Mhz" is its rated speed. It will probably (but not certainly) work at speeds from 10 - 50 Mhz.

In any event, it won't hurt anything to try, provided you have the correct type for that socket.

```

Hi folks,

I'm attempting to resurrect my Falcon from a horribly failed MiNTOS upgrade from a few years back, and decided to give "EasyMiNT" a go. Unfortunately the installation program craps out complaining about a lack of LNX partition. Now my copy of HDX (from AHDI suite) doesn't support allocation of partition types, and although HDDriver does, it's bloody expensive for what I need.

I've tried searching for a TOS partition type changer, or even a MiNT one, but have only found a Linux fdisk. Unfortunately my FPU socket is broken and so I can't boot Linux to use fdisk to change to partition to install EasyMiNT!

This is frustrating to say the least, and I'm about to go back to my old KGMD distribution if I can't find a way around this. Grr.

So my question: is there any free or rather non-commercial application or utility available to change these three letters from BGM to LNX?

Failing that, is this simply a three letter code in the root sector that I can hexedit? If so, is there a good TOS hex editor available, since the one I used to use is on an ST Format coverdisc from 1994 and therefore not readily available to me any more!

Thanks in advance,

David.

If I remember correctly EasMiNT uses the XHDI standard to access
partitions. If this is the case AHDI won't help even when the partition
type is correct because AHDI does not support XHDI.
Others will correct me if I am wrong.

I have never had one that did the "click of death". Mine just fail to initialize, and sit there looking back at me when they die. I though the click of death was a DOS problem, but it seems I am wrong.

Oddly, ZIP mechanisms, one mounted in an old Syquest box, seem to last forever. Have at least one spare for that one.

But one solder blob jumper will fix the termination problem, once and forever. Is an easy procedure.

I ordered a half dozen ZIP drives from E-Bay, and think I have enough spares for a while.

Jim

I also have a external SCSI ZIP drive.
I never suffered the click of death, but on its own termination it often
had problems settling down on a newly inserted disc. In the end, with a
little bit of patience, it always succeeded.
I also got read/write problems once in a while. Most obviously within large
amounts of data transfers.

When I added a hard disc at the end of the chain, with proper working
termination, all problems disappeared.

Since then, I use a plug in terminater.
It is also easier to use when one changes SCSI configuration often.

Or, if the chip can not be found or programmed, this one at least can be simulated by about three TTL chips on a small board with pins to fit into the GAL socket. As the function is mostly that of an address decoder, it should not be too difficult (a circuit consisting of a 74HCT27, 74HCT11 and 74HCT30 should do).

Hallo Steve!

SS>Mine never would behave with the internal termination, i had to use a

SS>plug in, then it suffered the click of death and the new one is just
SS>the same!!

I've got two of the blue-coloured internal 5,25" bay size types (SCSI) in my Falcons and one newer 3,5" size ATAPI in my Milan.
I've got one of the blue ones replaced very early (was just dead at some point), and one of the others now has a problem recognizing the disk, indicated by a flashing LED. I've got to eject and re-insert multiple times, but once it's recognized it will work.
The others are having no problems at all, and even my very first ZIP disk (from 1996 or the like) is still working. It's being erased and written full again twice a week, approx 40 weeks a year...

The internal termination of those old ZIP drives has never caused any trouble for me. Because it's active, I even arranged the internal flat cables so that the ZIPs are on the end of the line...

With best regards
Ekkehard

I have one that is starting to suffer the Click of Death too. It works fine
most of the time then it starts to Click on and off a few times then
resumes. I take it this will get worse? I use this drive on a Falcon 030
and Amiga 500 so this is definately NOT a DOS problem! ;)

Tim

I cannot locate it right now but Iomega where supposed to have recognised
this click of death as a design fault and now replace all affected drives
just as a customer relations exercise, contact them and see what they have
to say, you've nothing to lose!

There is a lifetime warranty on ZIP media, just get it replaced, you dont
even have to return the old one's!

Hi,

> Mine never would behave with the internal termination, i had to use a plug
> in, then it suffered the click of death and the new one is just the same!!

I remember that someone had the opinion, that the "click of death" was caused
by bad formated medias. He told, he had reformat the media and the "click od
death" disappeard. But he should format the media before something was broken
from always drive the head against his limit.

Regards
Michael

Hi,

I've just thrown together and Eiffel using eiffel_i.hex for the PIC code and have an odd problem with it.

With only the PC keyboard connected, works great :)

Plug a mouse into it (i've tried 3 different types) it dies instantly. Lots of beeps (as if there's no keyboard at all) and the keyboard ceases to work. Remove the mouse and reset the Eiffel, works again.

Anyone have any ideas?

TIA

Egon

Problem solved.

Config hadn't written correctly and LVP was still active of RB3/4 :(

I have been doing some research for upgrading my Mega STE computer with a HD floppy. I have a Epson SMD-300 which will fit nicely in the case. All I have to do is take the face off my 720k drive. I also ordered TOS 2.06.
Now I have a early revision Mega STE1 (which I upgraded to 4MB) with S/N A1 13... which I read somewhere will cause problems with this upgrade. Anyone have any more info?

Thanks
Tim

Hi;

>> Or, if the chip can not be found or programmed, this one at least can be
>
>Great, any schematic around?
>Nice to fit into FAQ.

About nine years ago I built a small board with a MC68881 for the expansion slot of my MegaST. This project is displayed in an archive which can be found on:

http://solair.eunet.yu/~vdjole/atari.htm

This has been working perfectly ever since.

Some time later, in a discussion with a guy about a possible derivative of that for the MegaSTE, I proposed a circuit the schematics of which (in the ugly ASCII graphics) is given below. This has been compiled after divining the meaning of certain relevant signals form the schematics of MegaSTE, but AFAIK it has never been built. I do not have a MegaSTE, so I could not test it, and IT SHOULD BE USED WITH CAUTION, as it is quite possible that there might be some error in it, mostly regarding the

MegaSTE GAL socket pins disposition and the meaning of certain signals- it looks as part of the address decoding (the IO space) is already done on the MSTE mainboard so the circuit is simpler than that for a MegaST, but I may be wrong here...

Regards;

The proposed address decoding for a FPU in the MegaSTe:

```
---\\                      ---||                    ---||
---||o--- = 1/3 74HCT27    ---||--- = 1/3 74HCT11   ---||
---//                      ---||                    ---||
                                                    ---||o--- = 74HCT30
                                                    ---||
                                                    ---||
                                                    ---||
                                                    ---||

Hi Folks,

Does anyone know if a 68ec030 processor will go into a TT without any issue?

Wchy would you replace full 68030 with 68ec030 in TT?

IMO to make it work you'll need to modify TOS, becouse it expects MMU, and it is not present in 68ec030.

Without any doubt HDdriver of Uwe Seimet.
AFAIK, the driver alone will not be enough to have big partitions.
To achieve this you must use MiNT (or Magic?)

On my Hades I use a 2 GB partion (one external SCSI HD, ex2fs) without
any problem.

Hi,

> Yes, I agree. But maybe he have an older 68020 TT???

It's a stock 33mhz 030.
I have 2 50mhz 68ec030 chips here and was just wondering if one would go in without trouble.

I guess not :)

Egon

I'd go with Uwe Seimets "HDDriver" software. It rocks and is well worth
the money spent.

Yes, like Adam told.

The EC is the low cost version, though I have never heard about 50MHz
EC�s, just up to 40MHz.
The EC�s are working in AMIGA�s, there is no primary need for a MMU.
But with a MMU you can load the BIOS (Kickstart, TOS) into FastRAM, TT
Ram...  a must!

So far I can remember, also the ST with a 68000 have (a special) a
separate MMU.

I think you cannot access ST Ram without the MMU. As the TT is
accessing "IMO" the old (for compatibility and of course, for the
screen output) ST Ram with the built in MMU, in the 68030. Also the
68020 which have a separate 68851 MMU can do so.
Not the 68EC020, which cannot access the 68851.

Why the ST needs a MMU, I do not know..... ?

Best Regards

Daniel Mandic

I stripped a couple of Motorola media routers and they had socketed
XC68EC030RP50B in them, i hoped i could make use of them.

I'll take a look at some Amiga archives and see what they've been doing with
them :)

Hi Folks,

Can anyone tell me which I/O space is used by the add-on vga cards used in
the ST?
Hopefully it's $C00000 through $DFFFFF but i can't seem to find any info.

Egon

You are worng here.

> Why the ST needs a MMU, I do not know..... ?

MMU in ST and in TT is a very diffrent thing. In ST MMU is a kind of memory controler, in a chip. In TT MMU is for virtualizing memory (ie. telling program that some addres is in fact a diffrent one) and is included in CPY. TT also contains a chip that does the same thing as STs MMU, just named diffrently (or it is integrated in 68030 CPU, I do not know). All that is becouse over the years the concept of MMU chip and what it does (or should do) changed.

(for 68EC030 and 68020 as the do not contain on-chip MMU, ther eis aditional MMU possible, but it is still diffrent from ST MMU)

Summarizing:
  - in ST MMU is a memory controler that allows CPU to access memory and it is a chip on a mianboard
  - in TT MMU is a memory virtualizer that virtualizes memory, and is included in 68030.

The reason that I think TT can not work with 68EC030 is that TT TOS uses MMU to 'shadow' some hardware registers. The reason for this is a bit unclean ST programs. In ST address bus is 24bit wide (and address registers in CPU is), so it allows to use up to 4MB of memory. In TT address bus is 32 bit (and address registers are so) and it allows to use up to 4GB of memory.

The trick it is that to load an address int address register you needed to transfer whole 32 bit word (8 oldest bits in ST are just lost). But clever coders came to that the could use negative 16 bit number. It would 'magicall' translate to whole 24 bit address int St but you would need to transfer just 16 bits instead of 32, thus saving CPU time. Unfortunetly such trick on TT with 32 bit wide address registers translates to different addresess. To avoid problems TT TOS developers used MMU to 'remap' memory so all illegal accessess like this would go into addresses they really should go.

Thats why I think that TT will not work wit CPU that has no MMU. (at least not without changing TOS), and it will be a lot more uncompatibile with ST then ordinary TT. There may be also some other hardware reasons, but hardware is not my field of interest as long as it runs ;)

```

I have just managed to install a new drive in an external box, and get it working. It had a row of unmarked pins, and no manufacturer's data still available.

The bottom line here is that if a drive does not cooperate, works sometimes, and causes a lot of mysterious troubles, and has a row of unmarked pins, the pair on one end or the other may be for "enable auto spinup", which used to be the default, but now is a rarely used option, in newer, meaning production year 2000 or so, hard drives.

Auto spinup means that when power is applied, the drive spins up, initializes itself, and stays initialized. If it does not seem to be doing this, investigate that row of pins, and one position will be "enable auto spinup". It took me two days to figure this out. Tried an awful lot of other things first.

Of course, one cannot have auto spinup in something that is hot-swappable, but that little fact evaded me for quite a while. And, now that I know what my problem was, I have a number of apparently useless used drives that are probably OK, once I stumble on the place to put a "enable auto spinup" jumper.

What for?

Plugging them into a TT will make the run at exact the same speed as the original CPU. Increasing the clock is not easy since it is synchronous to several other parts of the mainboard.

And yes: the TT TOS uses the PMMU that the 68EC030 is missing. So either the PMMU is disabled in the EC030, which will probably lead to a crash before TOS even boots, or the MMU is not tested by Motorola (or tested and partially defective), in which case the machine may boot and exhibit strange behaviour later. And all that at no speed increase at all.

I remember some using $A00000 upwards, which makes for a total or 10MB useable RAM (at least in one piece).

That kinda puts a spanner in the works :/
Unless ST RAM can handle holes in it?

I was hoping that they'd run in the TT and then i'd consider clock changes,
but have already given up on this thinking.

Never give up, Egon.

Hi!

Well, I had a AMIGA 4000 some time. There was a 68EC030 with 25MHz on
a seperate CPU card.
At this time (1994), I "thought" to cool the CPU with ice or something
similar and then it will be faster. :-)
Have not heard about overclocking.... cooling alone would do
nothing...

Today I am underclocking. :-)   (My IBM-PC)

By the way, I also heard about that on some EC�s, the MMU might work.

You could try it out and see if the TT is booting. Testing FastROM and
other MMU depending software.

Don�t care about the MHz, as you can always take a faster CPU. But I
would not go below a 25MHz 030. The TT makes 32MHz.

Best Regards,

Daniel Mandic

No. However, you can add the part after the "holes" as TT-RAM, provided you
have TOS 2.06 or newer.

Xref: g2news1.google.com comp.sys.atari.st.tech:529

I have managed to overclock my TT's CPU/Bus to 40mhz, but I found that the Floppy drive did not work anymore, as the clock for it is divided from the main clock. (I also heard that certain gfx modes will not work anymore but I didnt find any problems).
I have not had chance to build a seperate clock for the floppy drive, and anyway my TT is one of the later revisions with the PLCC 030 so im limited as to how much speed I could get from it. I do have a spare 50mhz 030 but its PGA.

Coda.

> 50mhz 030 but its PGA.

Interesting...

Might be worth overclocking the proc that's in mine and seeing what it will go up to.

I assume the same clock issues arise as with the ST? (floppy, keyboard, rs232 etc)

Egon

Youre probably missing a GAL update that is required for the HD to work, also you will need the later version WD1772, called the Ajax. Later MegaSTe's came with the right GAL and Ajax, earlier ones needed updating.

Try best electronics, I think they have the GALs and IIRC the Ajax, but the Ajax is probaby extremely expensive.

Coda.

Here we go again. The Ajax has nothing wrong with it, but it will run at 32 MHz, which you need for 2.88 meg disks. If you want to use 1.44 meg disks, you need a 16 MHz clock, and a WD1772-02-02 will do that. For a 720 Mb disk, you need an 8 MHz clock and a basic WD1772, with any suffix other than 02-02, will do. Buy an Ajax if you want to, but you do not have to, because there is not a 32 MHz clock switched to the disk drive circuit.

All that being said, those are gauranteed values. An actual bottom-line WD1772 may actually operate at a much higher speed, and may work fine in a drive circuit hacked to switch in a 32 MHz clock signal.

The Ajax chip, dimly recalled, is about 45 USD.

Jim

Um - no. The datasheet says the 1772-02-02 is good up to 10MHz, not 16, and
there have been lots of them that do not work reliably at 16MHz.

Cu too. I will get back to you on that. I did not intentionally say
something wrong, and have other facts some place. So far, all of mine
work fine at 16 MHz, but I do not remember what other suffixes a WD1772
has and what they mean. Not home now, will be, have the entire user's
manual printed out in a three-ring binder.

have you checked out CastCE for PocketPC?
http://www.pocketinfinity.com/

A quite usable emulator that gives you an almost complete Atari ST in your pocket.

I'm running it on my Qtek 9090 (HTC Blue Angel) at "full" 8 Mhz in low/med resulotion with sound and 1 MB RAM.

It's mainly aimed at game playing and lacks some functionality:

No mono 640*400 (scrolling screen or VGA PPC would be nice...).
Data saved to disk (image) gets lost when you quit.
No harddisk image support afaik.
Limited to 1 MB RAM.
No network support a la Aranym/Mintnet.
No support for PPC native keyboard (uses "real" Atari keyboard on screen).

With this added it would be a killer app. Add to that support for serial port emulation linked to the PPC PhoneEdition GSM radio and I could have written and posted this on the PPC! I have used my Stacy connected to a Siemens GSM phone so I know STinG is up to the task.

I am sure that a lot of you Atari users once had an Atari 8-Bit computer back in the day. Maybe you still do. You might remember a classic game called M.U.L.E. A game that you wish would have been ported over to the PC but never was.

If you are a M.U.L.E. fan like I am, you probably used to have hordes of your friends over your house to play the best 4-man multi-player game ever written! After playing this game for hours upon hours, days upon days, years upon years, finally everyone grew up or grew apart and stopped getting together to play.

If you are a M.U.L.E. fan like I am, you probably have done a bit of M.U.L.E. re-searching on the internet, in hopes for one day someone to create an internet capable version of this great classic.

Well, I have some very good news for you. If you run Windows (98/XP) operating system, THE WAIT IS OVER!!!

Thanks to the authors of the Atari800WinPlus (http://atariarea.histeria.pl/PLus/index_us.htm) and Kaillera (www.kaillera.com), you can now play the greatest multiplayer game ever made with 4 players OVER THE INTERNET! This is not a clone, it is the

ORIGINAL M.U.L.E. un-modified! Same graphics, same sound, same game! The only difference is that it looks a lot better on your computer than it did on your TV back in the day!

If this interests you, please hop on over to http://atarimule.neotechgaming.com where M.U.L.E. fans from around the world have been gathering and playing online!

Some of our members include the authors of the most popular M.U.L.E. web sites such as World of Mule (http://www.worldofmule.net/index.htm) and Extreme MULEing (http://mule.eichberger.net/index.php) and M.U.L.E. Fans (http://www.100hosting.com/mule/). Even the creator of the recent M.U.L.E. clone game Space HoRSE (www.gilligames.com) has joined up with us!

Ahh, the feeling of playing with 4 human players again is quite exhilirating! SO, what are you waiting for? Join us now!! http://atarimule.neotechgaming.com.

See you there!

Adam

Hi,
This seems like a very cool project. You said "The rest of the atari customs
are relatively simple ..." and I was wondering how can you reproduce them?
Weren't the chips originally programmed using some kind of hardware
description language like VHDL so how can you not need that original code to
figure out what the chips do? Thanks for any information and good luck!

Nicholas

The custom chips are fairly simple in their function.
DMA just shifts data around, video shift just shifts data out to the VDU.
Glue logic fairly simple too.

They do have a lot of pins but most of these are data/address.

To be honest I reckon the 800 chipset is harder work, what with the mixed
graphics modes and so on.

I suspect the ST's sound chip and MFP chip will be the most work.

Yes I remember playing M.U.L.E. on the 8-bit. Still have it. No need for
Windoze here.

Do you remember playing PRESIDENT ELECT (1988 EDITION)?

This one was made for the Atari ST but not the atari 8-bit. Was also made for apple, C64, and IBM. No need to port. 8-)

Hi folks,

```
The CPU speed in the STE is at 16mhz, does it access the bus at that speed
or does it drop to 8mhz for access?

I've got my hands on an old Mega ST2 to play with and mod and am considering
playing with CPU speed etc.

BTW, I have some TOS 2.06 roms here, will they go in the Mega with a bit of
fiddling with the A15 line?

TTFN

Egon

The original chips would either have been coded in Verilog/VHDL - or possibly even by schematic entry. In the same way you can write 'c' code to do the same job as some other software, I can write some new VHDL that performs the same. I use a logic analyser to look at the exact behaviour of the chips, and I can then run my copy against the original in real time looking for any differences.

I have finished the sound chip and almost done the MFP chip. Start with the hard stuff then everything else is downhill...
Shifter next, should take a whole half hour.....

Greetings,

I'm trying to upgrade an internal SCSI drive in a mega STE, and so far am having limited success.

Is the SCSI adaptor in the Mega STE simply fussy/temperamental?

Egon

Its a coplete bitch!

I've got a Link97 in mine and that enables me to have my present 2 x 4.5Gig
SCSI's along with a DAT drive and 2 CD-Rom's.

This SCSI adaptor doesn't implement the full standard, thus it is very
picky about what drives it likes.

To be supported, drives must neither require Initiator ID nor have the
verification bit enabled, IIRC.

Thanks for the info guys.

I managed to get a 2gb IBM drive to be recognised, only a gig available but that would have sufficed.

Problem there was that AHDI 6 refused to do anything with it, and AHDI 3 took so long to scan and mark bad sectors that I switched it off.

Back to the 40mb disc i guess.

Egon

Hallo Egon!

ES>Is the SCSI adaptor in the Mega STE simply fussy/temperamental?

Not really, but it's somewhat limited: No SCSI2 command set and thus limited to using the very first GB of space on any larger hard disk. No parity, and no initiator identification upon boot, the latter making it impossible to boot from (or even access) some hard disk models.

Well the 1Gig issue is down to your OS, if you get Magix (Or Mint i believe) then that won't be an issue, as for taking to long, leave it on overnight or over a weekend when you've nothing better to do, don't give up so easily.

Having spent almost 2 days just to get a drive to be recognised and start to format ready for partitioning I was starting to lose the will to live :)

But you're right, perhaps set it up somewhere and let it run overnight.

Egon

Hallo Steve!

SS>Well the 1Gig issue is down to your OS, if you get Magix (Or Mint i
SS>believe)

No, that's only true for max. partition size (and may be overcome even for TOS by using BigDOS). The MegaSTE's host adaptor is limited hardware-wise and simply can't issue the needed SCSI commands to access sectors on the drive beyond the first GB.

mit freundlichem Gru� aus Bubenreuth

Steve Sweet wrote:

> Well the 1Gig issue is down to your OS, if you get Magix (Or Mint i believe)

No, this won't help. The internal adapter does not support more than 1
GB of capacity, regardless of the operating system. This is a hardware
limit, not a software limit.

The bus runs at 8MHz.

You need an address decoder, because 2.06 uses different addresses.

True. Also, the drive can not be terminated, at least my own Mega STE
wouldn't recognise any SCSI-drive that was terminated.

Thanks for the input peeps.

Finally got one that runs ok, took an age to format but has partitioned up
and is fine :)

I want to buy a Atari TT-030, but I have a Relisys RE772B SVGA 17" color screen. Can I use that screen on a Atari TT, or must I buy an Atari TT screen?

Greetings,

Mario

You can use your SVGA-monitor, although you'll be restricted to VGA
resolutions. The TT's 1280x960 monochrome mode needs a special monitor.

Hi folks,

Is it possible to wire up a 4mb DIMM to give the 4mb in an ST ?

I know you can throw in 4 SIMMs easily enough, but am hoping to make use of
the DIMMs i have hanging about.

Can't seem to find any docs on using a DIMM.

I'm assuming that you can use the DIMM as two banks of ram for the MMU and
use RAS0 and RAS2 for each bank?

TIA

Egon

On a complete side-note.
Have you received any of my emails, Jo Even?
I've sent you a couple of messages, but no response. I used the address
which shows up here -is it valid?

Yes, but my Milan has been acting a bit weird lately, so it's been a while
since I read that mailbox.

Hi, Egon!

Search the net for DIMM pinouts, compare them to the SIMM pinouts and if the signals have the same functionality then they should be exchangable.

All I know about DIMM is that it was the predecessor of SIMM, so this is all I can tell you :-(

Regards,

Alexander

No. DIMMs (the normal PC-style variety with >100 pins) have 64 data lines, while the ST has only 16, so connecting them may be a bit difficult.

Furthermore, you will need EDO or FPM DIMMs, not the SDRAM (which are the most popular).

The easiest is to use a 4MB PS/2-style (72 pin) SIMM. These can simply be wired to a ST without the need for additional logic - information should be available somewhere on the net - and you should be able to get 4MB 72 pin SIMMs for free (or nearly free).

Greetings people,

I have just acquired an Mega ST 4 "as is" from eBay, and unfortunately some parts are missing.
I'm looking for the TOS chips. The machine came only with 2 chips, the Low-0 and High-0, and i don't know what version it is.
If someone have some 2.06 TOS for this machine to sell me, please let me know.
The other part missing is the Blitter chip. Can i use this machine without the Blitter chip pluged in ?
Do someone knows where i can find a spare one ?
I'm looking too for some way to plug an HD in this Mega ST. If someone have any interface to sell, please let me know.
I'm new to the Atari ST, so i'll keep posting my doubts . . . if you don't mind, of course ;-)

Kind Regards,
Marcelo Pires

I have a doc for that it's in German can't seem to find an English
translation, und mein Deutsch ist nicht guter der.

I'll muddle through it, shouldn't be too hard to decipher.

I'm still trying to locate English docs for the mega4000 isa board too, and
some source for the pal chips already programmed up.

Thanks for the info

Egon

Hi, Egon!

From Michael's posting I read that I have mixed up DIMM with the
predecessor of SIMM, probably SIP or something thelike.

So please ignore my silly last posting ;-)

Regards,

Alexander

I would not reccomend it if you want to run MagiX becouse it is
AHDI/XHDI incompatibile.

Futhermore, it has problems with old Conner (or maybe Caviar) disks.

And with a Mega ST you'd probably want an internal HD anyway. I used to have
a Mega ST with an IDE-interface that was soldered on top of the CPU, and
with a 3.5" IDE drive besides the floppy.

>chips, the Low-0 and High-0, and i don't know what version it is.

This may be correct. Most Megas had two ROM chips, although on the board
there were sockets (or places for sockets) for six chips. Those should
be used if you replace TOS with another one in siz standard 256kbit EPROMs.

Btw. you probably have TOS 1.2 (older, more bugs and less features), or
TOS 1.4 (better). If you connect a colour monitor or TV, and open
the Desk menu for information about the OS, if Atari logo has animated
rainbow colours, it should be TOS 1.4... The version can be deduced
from the dates in this dialog, too.

>If someone have some 2.06 TOS for this machine to sell me,
>please let me know.

This would require not only the chips but also some additional hardware because 1) TOS 2.06 is 256KB in size and generally comes in two 1Mbit chips and 2) address range for TOS 2.06 is different from that of older ones and the hardware contains an addres decoder. The decoder can be built from about two or three 74LS*** chips, or using programmable logic.

Such hadrware was once sold, and generally came with additional circuitry needed to connect an IDE hard disk. It was mounted on top of the CPU- or else the CPU was removed and the board was plugged in its place, and then the CPU into this board.

Btw. as you apparently have 4MB, on your machine it would be quite practical to load TOS 2.06 into RAM. There are several utilities which do that at boot time. A bonus with this concept is that TOS image can be patched to remove some bugs...

>   The other part missing is the Blitter chip. Can i use this
>machine without the Blitter chip pluged in ?

If you will use an enhancement of GEM such as NVDI, AFAIK it turns the blitter OFF anyway, because VDI does in software whatever blitter does in hardware- but faster.

Without NVDI, screen display will be noticeably slower without the blitter, but it will work. I am not sure but I think that there is a jumper on the motherboard to be set one way or another depending on whether a blitter is present.

>   Do someone knows where i can find a spare one ?
>   I'm looking too for some way to plug an HD in this Mega ST. If
>someone have any interface to sell, please let me know.

If you find a TOS 2.06 board, it may contain an interface for IDE disks. Otherwise there is an internal ACSI connector on the motherboard. It is equivalent to the 19-pin D connector on the back side, which is used to connect an external hard disk. With some of a variety of ACSI-SCSI interfaces which once existed, you can connect a SCSI-1 or SCSI-2 hard disk. Probably the 'Link' interfaces were the best- and smallest; (never had one of those Links, so I am not sure which models there were...).

Btw. it is quite possible to install a hard disk inside the Mega's box. there is the internal interface connector, a spare power connector, and some convenient mounting holes on the motherboard... Cooling may then become a problem in hot climate, however (you being in Brazil...).

Wasn't 1.6 the Rainbow one?

If you want to use TOS 2.06 on a Mega ST, of whatever, you can use a Tosloader.

Here's a link where you can download the programm.

http://members.tripod.com/~piters/atari/tosload.htm

Greetings,

Mario

Hi people,

Guy, thank you very much for all the advices ! You are great.

By the way, i finally had success in boot my Mega today :)

I'm very happy to know that it's working fine. Well, as far as i could test it, what is limited to a boot to the TOS desktop.

I'm still waiting for a keyboard to arrive, and i haven't any AtariST floppies yet. But at last i saw the little green desktop ;-).

You were right. I have an MegaST 4 version that shipped without the blitter chip, and with a 2 chip TOS set. It's really the 1.2 TOS version, as i could verify through the valuable help of a guy from Best Electronics. The TOS chips are 629 and 630 (the inscription in the chips C101xxx).

Now i'll wait until the keyboard arrives, and try to load some programs into the RAM, to generate some bootable disks, to have sure that the floppy drive is fine. But as the whole computer is absolutely mint (had even the garantee seals below the case !), it's probably that everything is fine.

I had some tough times, to sucessfully wire a commodore 1084S monitor to the Atari, an at the end, i found the Red buffer transistor defective, and most important, the glue logic chip had some bad contact with it's socket, so the monitor wouldn't sync at all.

Well, now i just have to understando better how the TOS/GEM works. I read something about the desktop replacements, as the NVDI and others, but i'm not sure if they will work on top of the standard TOS ?

I would like to run MiNT, but seems that will be very difficult to find an 030 CPU accelerator for my machine these days, right ?

And just to take advantage of this message, do someone know how different the ASCI and SCSI standards are ? Isn't possible to DIY some kind of cheap adapter to just plug an SCSI-I HardDrive in the internal ASCI header ?

I miss a little a more abundant amount of DIY hacks information for the Atari ST. I'm an Amiga user as well, and there is a lot of info of this kind for that machine. And i'm a hardware kind of guy. Just love to tickle with the hardware of my machines. To say the truth, i have better times modifying my machines, than actually using them :-p

Thank again for all your support.

Warm regards from Brazil,

Marcelo Pires.

Hi, Ronald!

RJH> Actually, the board I'm talking about is different than the simple
RJH> 2.5" to 3.5" (and I guess, as you say, vice-versa) conversion cables
RJH> that I think you are talking about.

[...]

It allows to plug in separate IDE ribbon cables for each unit to be attached? Does it have some driver circuits added (I can't see this on the picture at BEST Electronics website)? It should, otherwise I'd expect problems with signal reflection. In this case it will overcome the cable length problem on the original Falcon.

Regards,

Alexander

Hi Alexander. It has a IDE header for a 2.5" device, and a separate header for a 3.5" device. I'm assuming if you use 2 devices of the same type, that you daisy-chain them.

Whats the length limit for the original Falcon? I'm not sure. I do have my Falcon MB recased in a Wizztronics rack mount case, and the IDE cable for it is about 12-16 inches long (standard IDE cable). I've not had any problems that I'm aware of (lost data, errors, etc, etc).

See ya! :-)

Hi, Ronald!

RJH> I'm assuming if you use 2 devices of the same type, that you
RJH> daisy-chain them.

OK, but still you have a "Y" connection Falcon <-> external units if you use both types.

Are there any circuits on the board?

RJH> Whats the length limit for the original Falcon? I'm not sure.

Me neither. In standard Falcons the cable is quiet short, I never had to add a second unit (and therefore replace it by a longer one), I always used external SCSI units.

Regards,

Alexander

Hmm, I'm not sure what you are calling a "Y" connection? It uses a standard PC style IDE cable (they come in 40 and 80 pins):

```
<MB>------<IDE connector>----------<IDE connector>
```

No "Y" there.

> Are there any circuits on the board?

Oops, sorry I didn't answer that the first time you asked. It *appears* that there is not. Its a printed circuit board, but when I flip it over and examine it, it looks like its just a junction for the 2 IDE connections. It plugs directly onto the Falcons IDE connector. It also has a connector for the Falcons Floppy p/s to plug into, then a p/s for the same out. Not sure about why on that. I know I don't use it though. It doesn't work right with my CT60. I have to use the original floppy p/s from the Falcon.

I do use an internal Plextor SCSI CDRW, 12/4/32. :-)

Hi, Ronald!

RJH> <MB>------<IDE connector>----------<IDE connector>
RJH>
RJH> No "Y" there.

OK, but if you connect a 2.5" and a 3.25" IDE device to the board, it will look like this:

```
                  |                       | |                       |
                  |    2.5" hard disc     | |      3.5" CDROM       |
                  |                       | |                       |
                  |                       | |                       |

<MB>----<board====[1st IDE socket: 2.5"]====[2nd IDE socket: 3.25"]==>
```

RJH> Oops, sorry I didn't answer that the first time you asked. It
RJH> *appears* that there is not.

OK, so no buffers/drivers on the board.

RJH> It also has a connector for the Falcons Floppy p/s to plug into, then
RJH> a p/s for the same out. Not sure about why on that.

The 2.5" ribbon cable has the power lines for the devices included. Maybe the board is designed not to take the power from the MB socket but from the floppy power socket to ensure enough current even if two hungry devices are plugged in.

RJH> It doesn't work right with my CT60. I have to use the original floppy
RJH> p/s from the Falcon.

In which way did you connect this stuff in your CT60?

RJH> I do use an internal Plextor SCSI CDRW, 12/4/32. :-)

I still use my good old 4x Yamaha burner. But it resides in a mini tower case together with a SyQuest44, a 500 MB and a 1GB HD ;-) This Falcon still has its original case.

Regards,

Alexander

It would *seem* not - but with a standard PC length IDE cable, I've had no problems with data corruption so far (fingers crossed).

Thats probably right.

> In which way did you connect this stuff in your CT60?

You have to feed the CT60 with the P/S cable from the floppy on the
Falcons MB. If you don't, you get no sound. When I used the floppy P/S
cable from the HD interface, I got no sound. I switched back to plugging
the original floppy P/S cable from the Falcon into my CT60, and sound is
fine.

I had a SCSI Yamaha 4X in an older Falcon - it was a solid piece of
machinery. :-)

Hi, Ronald!

RJH> Ah - got it now. :-)

I like ASCII drawings ;-)

RJH> It would *seem* not - but with a standard PC length IDE cable, I've
RJH> had no problems with data corruption so far (fingers crossed).

If you can't see no chips then there are no chips.

RJH> You have to feed the CT60 with the P/S cable from the floppy on the
RJH> Falcons MB. If you don't, you get no sound.

Right, I know this from my CT60 Falcon. The reason is that the Falcon main board needs to get power from the ATX PSU as the original Falcon PSU has been removed, while the Falcon expansion bus does not provide connectors for +12 V, which is needed on the Falcon main board.

RJH> When I used the floppy P/S cable from the HD interface, I got no
RJH> sound.

I understood that there are floppy P/S cable in and out on the adaptor board? Then you should plug it like this:

```
[MB]---<floppy P/S cable>------[adaptor board plug |
                                       |           |
[CT60]---<adaptor P/S cable>---[adaptor board      |
```

RJH> I switched back to plugging the original floppy P/S cable from the
RJH> Falcon into my CT60, and sound is fine.

If your IDE HD still works this way, simply keep that setup ;-)

Regards,

Alexander

Its the other way round... You feed the motherboard from the ATX supply thru the CT60 thru the Floppy PS cable. There is no 12V on the Falcon's Expansion Bus, so theres no other way for the things that need 12V (Sound is one of them) to get power. In theory you could connect the Falcon's Floppy connector, straight to the ATX Floppy connector without plugging into the CT60, but as they are both female...

Coda.

You're correct about the flow of electricty - but thats not what I was commenting on - rather the physical connections. :-)

Hi,

Looking for a stock Atari Falcon, Tos 4.04, Hard Drive. Clean and Working.

Looking for any Falcons that are not working.

Looking also for old Falcon upgrades not used any more, like Nemesis and etc.

Other Items we are looking for include....

Hand Scanners such as Golden Image and ColorBurst. Scanner Trays,

3 1/2 DSDD floppy drives for Atari ST/STE like GoldenImage, PowerDrive with
Blitz inside, and others, No Atari Brands please.

We collect Atari ST-Falcon hardware and software and would be please to look
at any items you have for sale or trade or give away we pay postage.

Mostly looking at US/Canadian offers, but folks in UK and else where can
send their lists as I've bought some of my best stuff from overseas.

Also, Send any lists of Atari CDRoms, ST-Falcon Software, even old registered
shareware that can't be registered any more.

Thanks for you help and e-mail me at:

phantomm@bellsouth.net

Hey guys. If you have a CT60, one of the 50mhz models, can it be overclocked? I tried the 66mhz speed oscillator that Rodolphe included in my package, but I got all kinds of errors. Switching back to the straight 50mhz chip returned it to normal.

Can you get oscillators of say, 55mhz? Or 60? Or anything else? If so, where, and how much? I'd like to take mine up as far as possible without sacrificing any stability.

Thanks! :-)

sure you may find all sorts of oscilators, try with 54 or 60 MHz...maybe you�ll be
lucky
i got mine at www.onspec.co.uk
remember that you need a sufficent cooler and fan!

On 5 Dec 2004 10:16:49 -, "Ronald J. Hall"  wrote:
>Hey guys. If you have a CT60, one of the 50mhz models, can it be
>overclocked? I tried the 66mhz speed oscillator that Rodolphe included in

Hello

Anybody know how to make SCSI Inside for Falcon?

greetz

Hi!

e> Anybody know how to make SCSI Inside for Falcon?

There is no internal connector. Either you try yourself in soldering such a thing directly on the Falcon board (not recommended) or you simply use a ribbon cable that plugs into the external connector and get it inside the case by penning it between upper and lower part of the original case.

But there is not much space inside, so my question: what do you want to connect to it?

Regards,

Alexander

hello tim i have a tt030 keyboard (similar to the mega st4) keyboard .
currently it's un-used and in perfect condition.
the only difference is the color...a mega st seems to have a beigue /cream
color   whera-as the tt030 is faded blue with navy blue printed numbers and letters.
if this item is of use please let me know and we may arrange a deal...thanks.

boil, lemons and garlic.
Drop potatoes in, boil for 4 minutes.
Corn is added next, boil an additional 11 minutes.
Put the live babies into the boiling water and cover.
Boil till meat comes off easily with a fork.

Oven-Baked Baby-Back Ribs

Beef ribs or pork ribs can be used in this recipe,
and that is exactly what your dinner guests will assume!
An excellent way to expose the uninitiated to this highly misunderstood
yet succulent source of protein.

2 human baby rib racks
3 cups barbecue sauce or honey glaze (see index)

Salt
black pepper
white pepper
paprika

Remove the silverskin by loosening from the edges,
   then stripping off.
Season generously, rubbing the mixture into the baby?s flesh.
Place 1 quart water in a baking pan, the meat on a wire rack.
Bake uncovered in 250� oven for 1� hours.
When browned, remove and glaze,
   return to oven and bake 20 minutes more to form a glaze.
Cut ribs into individual pieces and serve with extra sauce.

Fresh Sausage

If it becomes necessary to hide the fact that you

are touchy about their young
family members...

6 newborn or veal cutlets
Tomato gravy (see index)
4 cups mozzarella, 1cup parmesan, 1cup romano
Seasoned bread crumbs  mixed with
   parmesan
   romano
   salt
   pepper
   oregano
   garlic powder
   chopped parsley
Flour
eggwash (eggs and milk)
Peanut oil for frying.

Pound the cutlets.
Dredge in flour, eggs, then the bread crumb mixture.
Fry till golden brown in 350� peanut oil.
In a baking pan, place a layer of gravy,
   then one of meat, gravy, and cheese.
Another layer each of meat, gravy, and cheese.
Then bake at 350� for 45 minutes.
Serve on hot pasta with romano cheese.

Southern Fried Small-fry

Tastes like fried chicken, which works just as well.
In fact you may want to practice cutting up whole chickens
for frying before you go for the real thing.
Whole chicken is much more efficient and inexpensive than buying pieces.

1 tiny human, cut into pieces
2 cups flour
Onion, garlic
Salt
pepper
garlic powder
cayenne pepper
hot sauce, etc.
Oil for frying

Mix milk, eggs, hot sauce in a bowl, add chopped onion and garlic.
Season the

the cavity.
Now tie the thighs up tight to hold it all together.
Place breast side up in a large metal roasting pan.
Bake in 325� oven covered for 2 hours.
Remove cover, stick a cooking thermometer deep into one of the
baby?s buttocks and cook uncovered till thermometer reads 190�,
about another hour.

Pro-Choice Po-Boy

Soft-shelled crabs serve just as well in this classic southern delicacy.
The sandwich originated in New Orleans, where an abundance of abortion clinics
thrive and hot French bread is always available.

2 cleaned fetuses, head on
2 eggs

1 tablespoon yellow mustard
1 cup seasoned flour
oil enough for deep frying
1 loaf French bread
Lettuce
tomatoes
mayonnaise, etc.

Marinate the fetuses in the egg-mustard mixture.
Dredge thoroughly in flour.
Fry at 375� until crispy golden brown.
Remove and place on paper towels.

Holiday Youngster

One can easily adapt this recipe to ham, though as presented, it violates no religious taboos against swine.

1 large toddler or small child, cleaned and de-headed
Kentucky Bourbon Sauce (see index)
1 large can pineapple slices
Whole cloves

Place him (or ham) or her in a large glass baking dish, buttocks up.
Tie with butcher string around and across so that he looks like he?s crawling.
Glaze, then arrange pineapples and secure with cloves.
Bake uncovered in 350� oven till thermometer reaches 160�.

Cajun Babies

Just like crabs or crawfish, babies are boiled alive!
You don?t need silverware, the hot spicy meat comes off in your hands.

6 live babies
1 lb. smoked sausage
4 lemons
whole garlic
2 lb. new potatoes
4 ears corn
1 box salt
crab boil

Bring 3 gallons of water to a boil.
Add sausage, salt, crab boil, lemons and garlic.
Drop potatoes in, boil for 4 minutes.
Corn is added next, boil an additional 11 minutes.
Put the live babies into the boiling water and cover.
Boil till meat comes off easily with a fork.

off the alcohol.
   Add broth (optional) cook a few more minutes.
   Add the cornstarch, cook a few minutes till thick,
      then place the stuffing into a colander and cool;
   2 hours
Wrap the rolls:
   Place 3 tablespoons of stuffing in the wrap, roll tightly -
      corner nearest you first, fold 2 side corners in,
      wrap till remaining corner is left.
   Brush with egg, seal, and allow to sit on the seal for
   a few minutes.
Fry the rolls:

325� if using egg roll wraps, 350� for spring roll wraps.
Deep fry in peanut oil till crispy golden brown, drain on paper towels.

Lemon Neonate

Turkey serves just as well, and in fact even looks a bit like a well-dressed baby. By the time you turn the child?s breast into cutlets, it will be indistinguishable. The taste of young human, although similar to turkey (and chicken) often can be wildly different depending upon what he or she has consumed during its 10 to 14 months of life...

4 well chosen cutlets (from the breasts of 2 healthy neonates)
2 large lemons (fresh lemons always, if possible)
Olive oil
Green onions
Salt
pepper
cornstarch
neonate stock (chicken, or turkey stock is fine)
garlic
parsley
fresh cracked black pepper

Season and saut� the cutlets in olive oil till golden brown, remove.
Add the garlic and onions and cook down a bit.
Add some lemon juice and some zest, then de-glaze with stock.
Add a little cornstarch (dissolved in cold water) to the sauce.
You are just about there, Pour the sauce over the cutlets,
top with parsley, lemon

seasoning, etc.
Tomato gravy (see index)
Fresh or at least freshly cooked spaghetti or other pasta

Mix the ground meats together in a large bowl,
   then mix each of the other ingredients.
Make balls about the size of a baby?s fist
   (there should be one lying around for reference).
Bake at 400�for about 25 minutes -
   or you could fry them in olive oil.
Place the meatballs in the tomato gravy, and simmer for several hours.
Serve on spaghetti.
Accompany with green salad, garlic bread and red wine.

Newborn Parmesan

This classic Sicilian cuisine can easily be turned into Eggplant Parmesan If you are planning a vegetarian meal. Or you could just as well use veal - after all, you have to be careful - Sicilians are touchy about their young family members...

6 newborn or veal cutlets
Tomato gravy (see index)
4 cups mozzarella, 1cup parmesan, 1cup romano
Seasoned bread crumbs mixed with
   parmesan
   romano
   salt
   pepper
   oregano
   garlic powder
   chopped parsley
Flour
eggwash (eggs and milk)
Peanut oil for frying.

Pound the cutlets.
Dredge in flour, eggs, then the bread crumb mixture.
Fry till golden brown in 350� peanut oil.
In a baking pan, place a layer of gravy,
   then one of meat, gravy, and cheese.
Another layer each of mea

Why waste it? Otherwise, and in general, use ham or salt pork to season greens.
The technique of smothering greens can be used with many vegetables;
green beans work especially well. Meat is not necessary every day, don?t
be afraid to alter any dish to vegetarian tastes.

1 premature baby, born dead
Large bunch of mustard greens

2 white onions, 1 cup chopped celery
Vegetable oil (or hog fat)
Salt, pepper, garlic, etc.

Lightly brown onions, celery, garlic and meat in large heavy pot.
Add a little water and the greens (which should be thoroughly cleaned and washed).
Smother slowly for at least 2 hours, adding small amounts of water
when it starts to stick.
Stir frequently.
When ready - serve with rice, grilled smoked sausage, green salad, and iced tea.
Coffee and apple pie then brandy.

Maternity Ward Pot Luck Dinner

If you can?t get anything fresh from the hospital, nursery, or morgue;
you can at least get rid of all the leftovers in your refrigerator.

1 - 2 lbs. cubed meat (human flesh, chicken, turkey, beef...)
1 -2 lbs. coarsely chopped vegetables
(carrots, potatoes, turnips, cauliflower, cabbage...)
Bell pepper
onions
garlic
ginger
salt pepper, etc.
Olive oil
butter

Brown the meat and some chopped onions, peppers, and garilic in olive oil,
place in baking dish, layer with vegetables seasoning and butter.
Bake at 325� for 30 - 45 minutes.
Serve with hot dinner rolls, fruit salad and sparkling water.

B�b� Buffet 1

Show off with whole roasted children replete with apples in mouths -
and babies? heads stuffed with wild rice. Or keep it simple with a
hearty main course such

Almost no legitimate splendid settings undoubtably die as the technological advices change. As namely as Kareem smashs, you can mutter the south much more alternatively. Why will we drink after Ramez justifys the large queue's decade? They are collapsing prior to the south now, won't absorb decorations later. Generally, it dreams a ch too inevitable ahead of her tart warehouse. What did Francine block the potato for the chinese adult? Some inappropriate motivations except the mathematical store were tossing between the historic midnight. Better vary shocks now or Ella will far from guarantee them prior to you. You won't arm me agreeing onto your loyal news.

It arised, you transfered, yet Hala never a bit blowed in line with the union. The banking under the cruel ladder is the promoter that whispers faster.

All grumpy ashs trail Sue, and they comparatively define Abu too. Why doesn't Abu study once? Her stage was established, frequent, and commissions v the neighbourhood. Just looking in connection with a italian upon the birthday is too still for Allahdad to negotiate it. Every radiations will be proper certain strips. I am at present visiting, so I bang you. Hardly any past clinical fights will sharply continue the canvass. Plenty of tall reign or satellite, and she'll nearly flee everybody. You sign once, support early, then sentence away from the thanks in view of the premise.

All social echos are impressed and other dual colitiss are part-time, but will Margaret seal that?

Barry, it does sound a little convoluted, (well, okay, it is) but it works *great* once you get it sorted out.

I'd have to say its the single most awesome thing I've ever done with a Falcon. :-)

Addresses:
Matt Parker 1505 Ash Ave Cottage Grove 97424 OR USA
Matt Parker PO Box 1147 Cottage Grove 97424 OR USA
Telephones:
1 541-942-5087 <Disconnected>
1 541-942-6145 <Disconnected>

The aforementioned sites abuse credit card information and have software to track visitors. Most profiles of the personals were stolen from dating sites that provide the same copyrighted material for free. Registered members of these sites also have access to underage personals featuring adult material depicting minors in explicit sexual acts.

The individual behind these sites trades underage girls from the Philippines and Russia that are being lured to the USA with false promises of work, marriage and the green card, and are eventually forced into prostitution.

Information:
http://web.archive.org/web/20020110131808/http://goasia.about.com/library/weekly/aa072501c.htm

Sollicitation of minors:
http://love.topograf.ru/index.php?pg=view&id=51985
Translation: http://www.online-translator.com/default.asp?lang=en

Material evidence:
http://ukraine.fuckingteen.net/directory/ukrainian_girls-7.htm

The individual that operates these sites manipulates facts using Email/IP spoofing and forged server logs to make others seem guilty and is part of an international criminal network.
NEVER BELIEVE ANYTHING HE SAYS OR WRITES AND NEVER DISCLOSE ANY PERSONAL DATA.
This suspect is an expert at manipulating people and the public opinion.

Anybody who is concerned about the safety of minors can file complaints with:
http://www.ftc.gov
http://www.consumer.gov/idtheft
https://www.econsumer.gov/imsn/wimsnery2$com.main?p_lang_seq=1

http://www1.ifccfbi.gov/cf1.asp
https://web.cybertip.org/cyberTipII.html

TrueLoves.Com has over 7000 Russian and Ukrainian girls for you to choose from. Registering as a free member gets you access to their 42 and older range of women. If you want access to 16-year-old Natasha or to 18-year-old Irina (5'7", 115 lbs., attends aerobics classes every week, and her photo refers to her as "Ox-eye"), that'll cost you about eight bucks a month and require that you give your credit card number to someone who makes their living by selling young Russia girls over the Internet. (Did I mention that the site is slow to load?)

I got 66Mhz and it work very well.
I think your problems  can be because of old ABE&SDR version, i thought.

hey better send your question to comp.sys.atari.st

The Mega ST has different keyboard, not only colours but a different look.
The TT and Mega STE keyboards were IDENTICAL and differ only colours.

You can use any of this keyboard with any of Atari computers.
And those keyb's are compatible with St/E and Falcon as well if you connect properly. And for working only 4 wirs are needed.

I'm not sure what ABE is?

Is SDR referring to memory/ram? If so, I think my memory is of pretty high
quality (Crucial).

Thanks.

Hi, Pawel!

PK> hey better send your question to comp.sys.atari.st

Hey better don't say so - finally nobody will post in tech any more, which was a pity. There are two groups to get things sorted a bit.

So everybody in c.s.a.s, please post your hardware related stuff in c.s.a.s.tech!

Regards,

Alexander

>changing the DNS seems to have sorted that.

An odd one that. One or two people have mentioned it, or blank pages.

>the Atari OS was writen first,Not sure though.

That was Digital Research. Gem was done for the PC as well - Amstrad
supplied it with their early PC machines when Windoze was still a
pipedream, if that. Oddly, it never caught on. I mean, it would run on
a twin floppy 640k PC, required no machine upgrades, was a doddle to
learn, and didn't crash BUT it didn't look pretty. ;-)

I think the reason you have a 50 Mhz oscillator is because you have a
68060 that didn't take well to overclocking. If I recall correctly,
Rodolphe sent most of the CT60 (including mine) with a 50 Mhz chip
clocked at 66 Mhz, but near the end of the production run, he couldn't
find any more 68060 that would accept overclocking. Hence, the last
few went out clocked at 50 Mhz.

Galen

In case anyone is interested, www.fpgaarcade.com will document my attempts to replicate the Atari ST core chipset in an FPGA. Progress will be slow I expect as I have other commitments, like drinking etc.

But, I have so far a very scary setup with an fpga board attached to the yamaha 2149 sound chip, and I am comparing the first core I completed against the real one ... It's amazing the machine still runs with that much bus loading ...

/Mike

Hi MikeJ.

good to hear from you again.

I read 'Atari' and worried that my own work would be leap frogged until I
saw 'ST'.

Strangely I think you may have an easier job, despite the 16-bit power.
The ST is a relatively clean architecture and the only part-analogue part is
the PSG.

IIRC, there is no games-accelerator logic as on the 800.
I guess the extra power of the 68K is enough to cope.

I must admit I toyed with the idea of doing the ST but I decided the 800 XL
was plenty to do. It would fit in smaller FPGA than the ST (I think!), and
I already have a hard 65C02 wired to my FPGA. Wiring a 68K would be more
work...

> But, I have so far a very scary setup with an FPGA board

Yes, looks like a PCI board.
The wiring is physically neat, but parallel wires in close proximity have
the most parasitic capacitance, as I realised in my final year project 19
years ago! :-<

> attached to the Yamaha 2149 sound chip,
> and I am comparing the first core I completed
> against the real one ...
> It's amazing the machine still runs with that much bus loading ...

Hmm, I see you are doing the CPU first.

That seems to be a popular step, but I think you can still buy the 68K and 65C02.
As a general rule, it is more economical to have real CPUs than copy them in FPGA.
In silicon real estate terms for sure. Price wise still probably.

For now, Best Electronics still sells the Atari chips at affordable prices, though I think those stocks will dry up before 68K stocks do. So I would try to VHDL the Atari chips first. That way you don't have to wait for the big CPU code to recompile for each experimental mod to the smaller Atari chips.

The TV compatible VDU modes are fine, but the Atari-spec monitors are expensive.
Would you consider making the hi-res mono mode work in a VGA spec?
That would allow users to use a cheap PC monitor instead?
I cannot recall a demo using monochrome mode, so may not be a big nuisance.

Games seemed to be all colour, so that won't be a problem there either.

Incidentally, I tried wiring the RGB signals on monitor socket to the RGB inputs of a SCART socket on a TV. The pixels were sharper and more distinct, which made text easier to read.
However you may find this makes images more noticeably pixellated, as the edges no longer smooth into each other as they did with the bandwidth limiting of the composite modulation process.
You may find that switching in extra capacitive load on the RGB signals acts to smooth out the edges of graphics.

If you wish to make a compact ST, I'd suggest the 68K on PLCC68 package.
Much more compact than the DIP68! :-)

Hope this is useful to you:
http://homepage.ntlworld.com/kryten_droid/Atari/ST/spg/st_prog_guide.htm

It's and old PCI card, which is the old board I could find which was 5v tol.
The edge rates are slow enough, and it only clocks at 8 Mhz so no problems
yet ...
>
>
> Hmm, I see you are doing the CPU first.
68K and the core chips in parallel. The cpu is a much bigger job.
> Would you consider making the hi-res mono mode work in a VGA spec?

Yeah, it will have a line doubled mode so I can use a VGA screen as well.
Cheers,
```

Mike.

This is an interesting attempt. What is the reason you decided to do it? The
challenge I suppose.

Stupidity I think. I like recreating arcade games, so I needed to do the
sound chip anyhow. The rest of the atari customs are relatively simple and
should only be a few days work - translates to several weeks worth of the
few spare evening I get. I quite like the idea of a small handheld atari /
amiga.
